CERIO Corporation

CenOS 5.0 Software

Access Point for User Manual

FCC Warning

This device has been tested and found to comply with limits for a Class A digital device, pursuant to Part 2 and 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiates radio frequency energy and, if not installed and used in accordance with the user’s manual, may cause interference in which case user will be required to correct the interference at his own expense.

CE Mark Warning

This is a Class A product. In a domestic environment, this product may cause radio interference in which case the user many be required to take adequate measures.

1. Software Configuration

1.1 Configuration Network

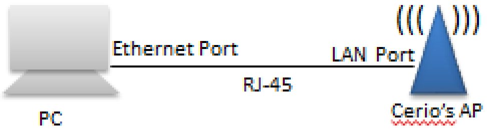
CenOS 5.0 APs supports web-based configuration. Upon the completion of hardware installation, **APs** can be configured through a PC/NB by using a web browser such as Internet Explorer 6.0 or later.

- **Default IP Address**: 192.168.2.254
- **Default Subnet Mask**: 255.255.255.0
- **Default Username and Password**

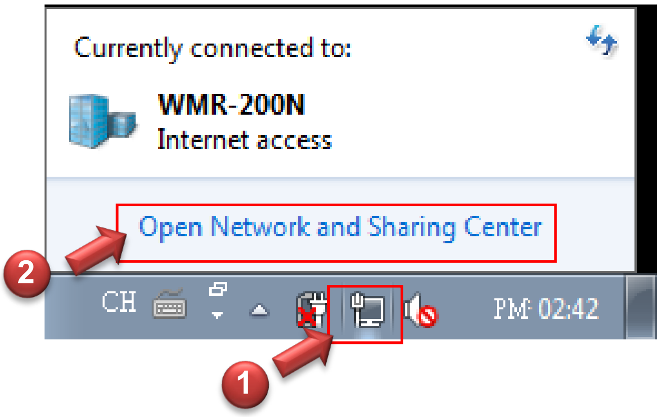
IP Segment Set-up for Administrator's PC/NB

Set the IP segment of the administrator's computer to be in the same range as the **CenOS 5.0 AP** for accessing the system. Do not duplicate the IP Address used here with IP Address of the **CenOS 5.0 AP** or any other device within the network.

The following setup uses a Windows 7 PC, user OS may vary



Step 1: Please click on the computer icon in the bottom right window, and click **"Open Network and Sharing Center"**

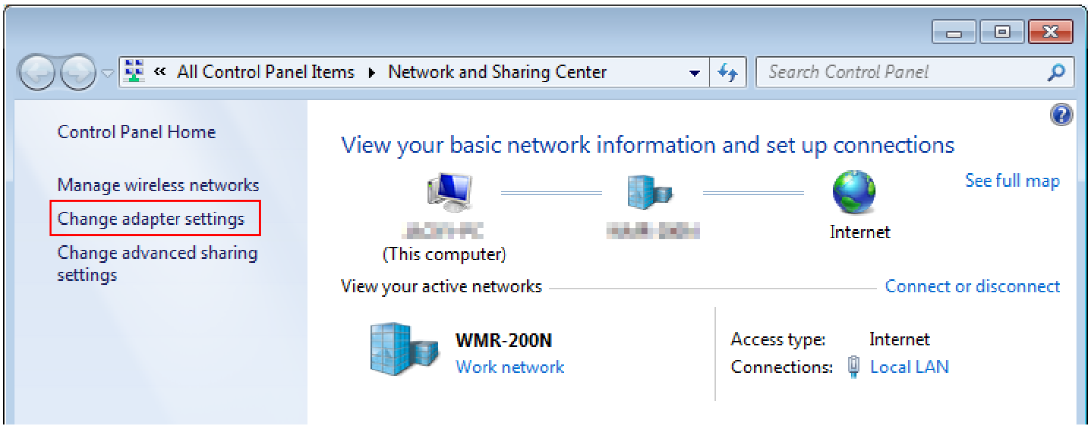


Currently connected to:

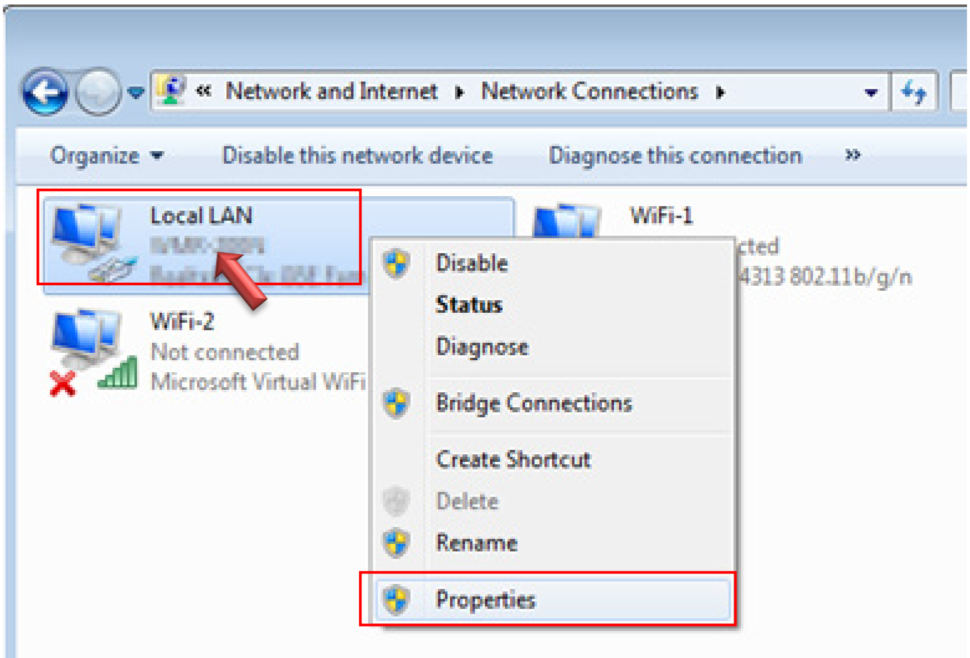
WMR-200N
Internet access

Open Network and Sharing Center

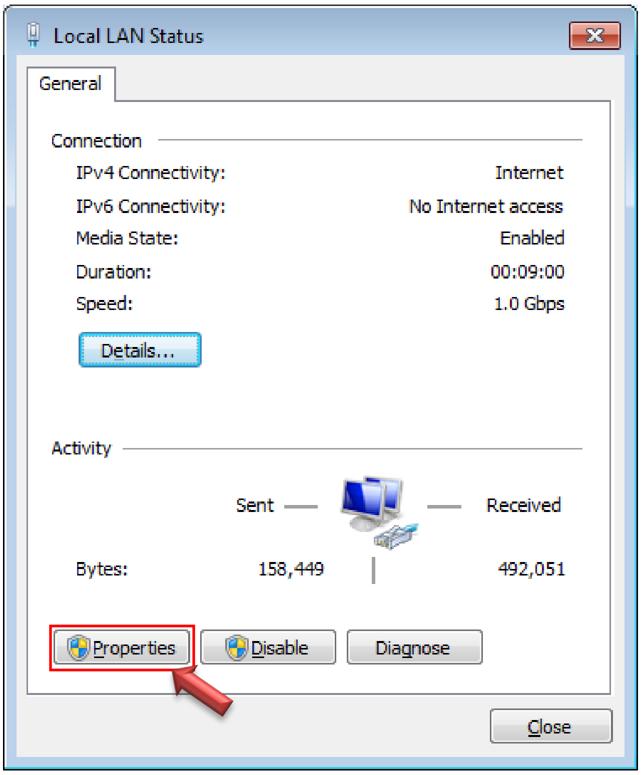
Step 2: In the Network and Sharing Center page, please click on the left side of **"Change adapter setting"** button



Step 3: In **"Change adapter setting"** Page. Please find Local LAN and Click the right button on the mouse and Click **"Properties"**



Step 4: In **"Properties"** page, please Click **"Properties"** button to TCP/IP setting



Local LAN Status

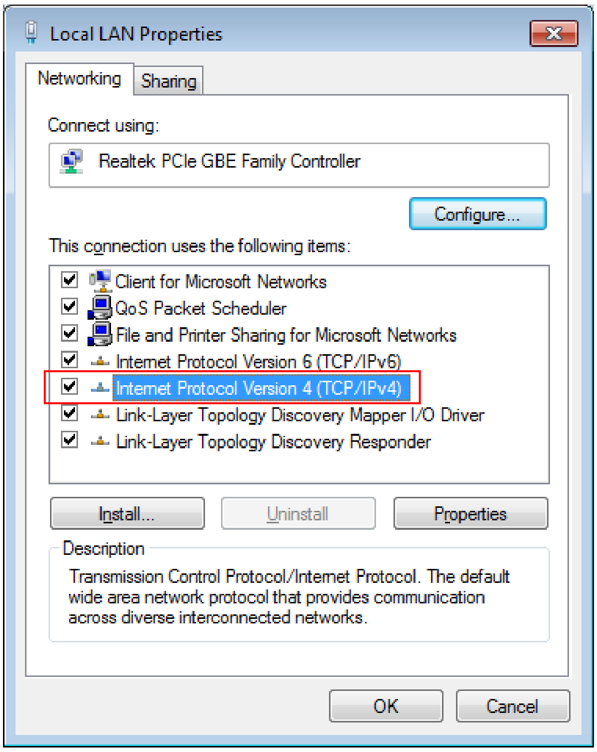
General

Connection

IPv4 Connectivity:	Internet
IPv6 Connectivity:	No Internet access
Media State:	Enabled
Duration:	00:09:00
Speed:	1.0 Gbps

	Sent	Received
Bytes:	158,449	492,051

Step 5: In Properties page to setting IP address, please find **"Internet Protocol Version 4 (TCP/IPv4)"** and double click or click **"Install"** button.



Local LAN Properties

Connect using:

Realtek PCIe GBE Family Controller

This connection uses the following items:

- ☑ Client for Microsoft Networks
- ☑ QoS Packet Scheduler
- ☑ File and Printer Sharing for Microsoft Networks
- ☑ Internet Protocol Version 6 (TCP/IPv6)
- ☑ Internet Protocol Version 4 (TCP/IPv4)
- ☑ Link-Layer Topology Discovery Mapper I/O Driver
- ☑ Link-Layer Topology Discovery Responder

Description

Transmission Control Protocol/Internet Protocol. The default wide area network protocol that provides communication across diverse interconnected networks.

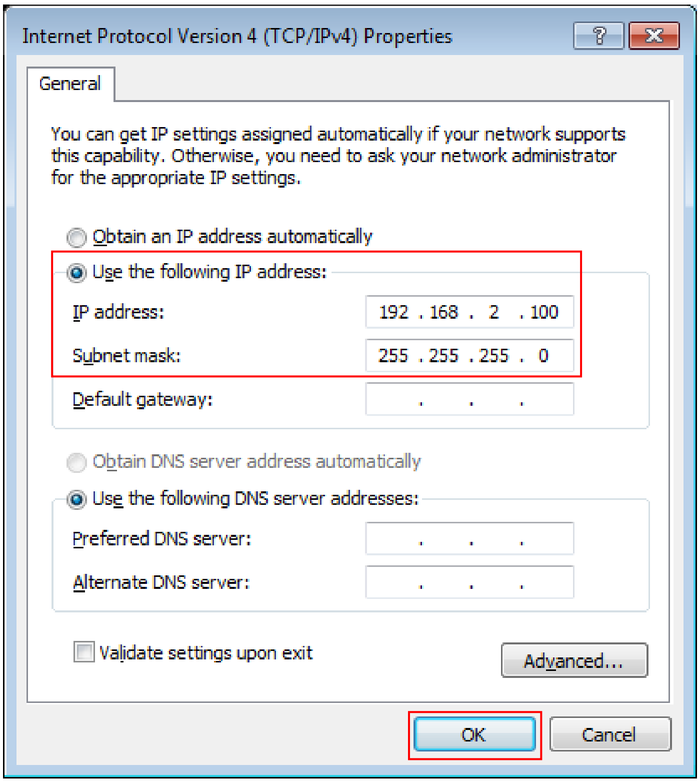
Step 6 :

Select **“Use the following IP address”**, and fix in IP Address : 192.168.2.#

ex. The # is any number by 1 to 253

Subnet mask : 255.255.255.0

And Click **"OK"** to complete the fixed computer IP setting



Internet Protocol Version 4 (TCP/IPv4) Properties

General

You can get IP settings assigned automatically if your network supports this capability. Otherwise, you need to ask your network administrator for the appropriate IP settings.

○ Obtain an IP address automatically

● Use the following IP address:

IP address: 192 . 168 . 2 . 100

Subnet mask: 255 . 255 . 255 . 0

Default gateway: . . .

○ Obtain DNS server address automatically

● Use the following DNS server addresses:

Preferred DNS server: . . .

Alternate DNS server: . . .

□ Validate settings upon exit

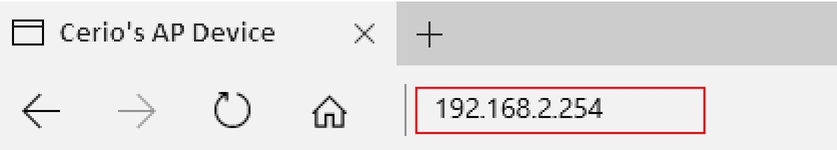
Please Open Web Browser

Without a valid certificate, users may encounter the following problem in IE7 when they try to access system's WMI (https://192.168.2.254). There will be a “Certificate Error”, because the browser treats system as an illegal website.

1.2 Login Web Page

Launch Web Browser

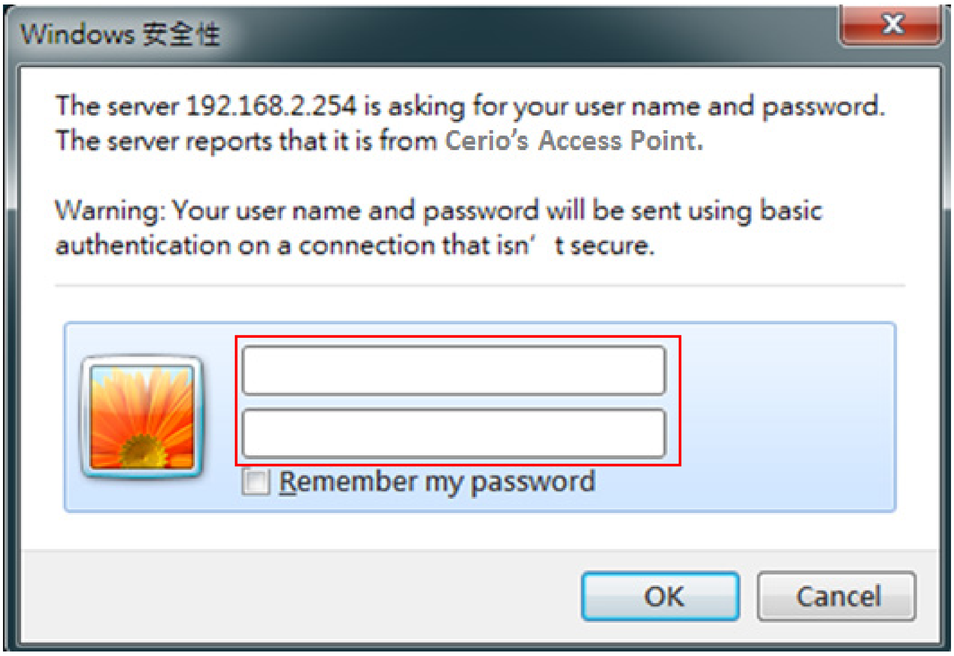
Launch as web browser to access the web management interface of system by entering the default IP Address, http://192.168.2.254, in the URL field, and then press Enter.



Cerio's AP Device

192.168.2.254

System Login



The server 192.168.2.254 is asking for your user name and password. The server reports that it is from Cerio's Access Point.

Warning: Your user name and password will be sent using basic authentication on a connection that isn' t secure.

□ Remember my password

Please use default Users name: **"root"** and default password **"default"** to login.

Notice	When the setting is complete, be sure to return to Step 6, the computer's IP back to automatically obtain IP address, or manual set the same C Class network.

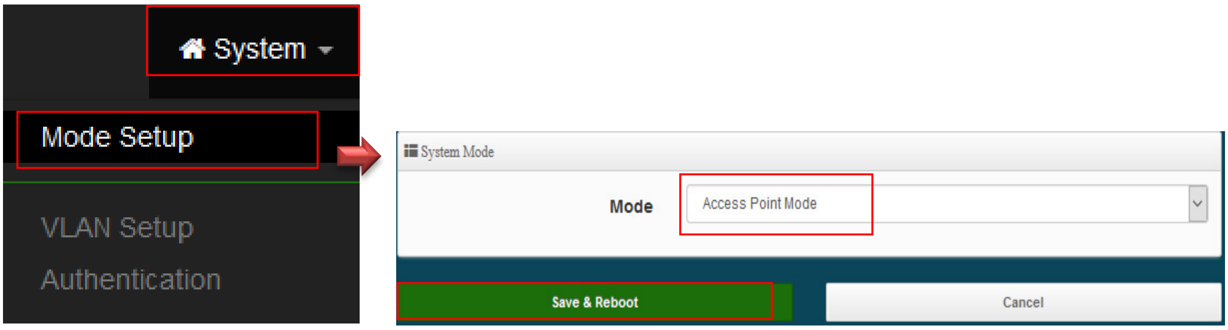
2. Software Setting

2.1 Operating Mode Introduction

Notice Not all CenOS 5.0 devices support all five operation modes. Please reference the proper AP model's data sheet to see which operation modes are supported.

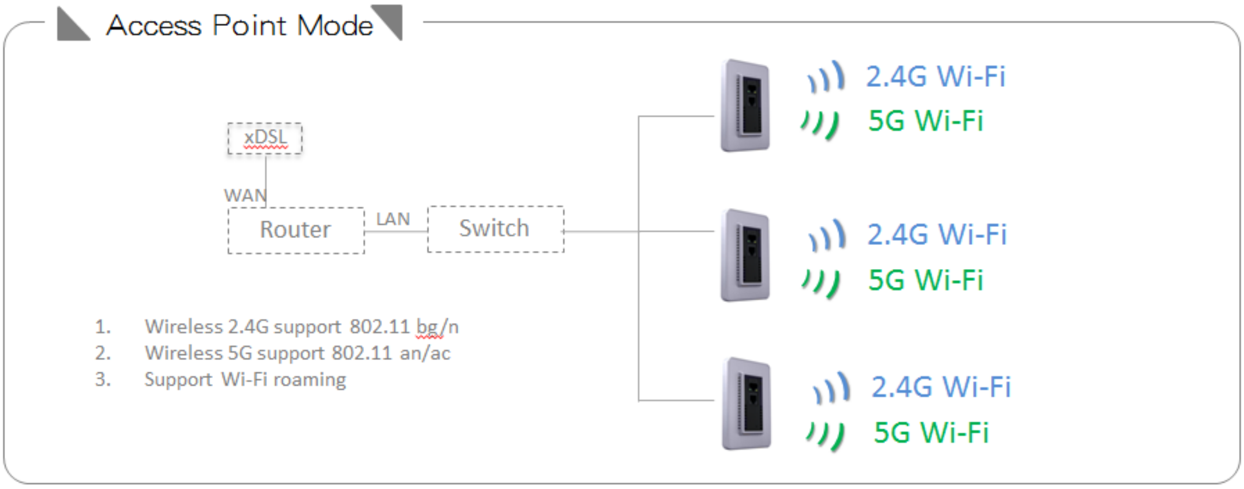
Access Point Mode

Please click on System ->Mode Setup and choose Access Point Mode

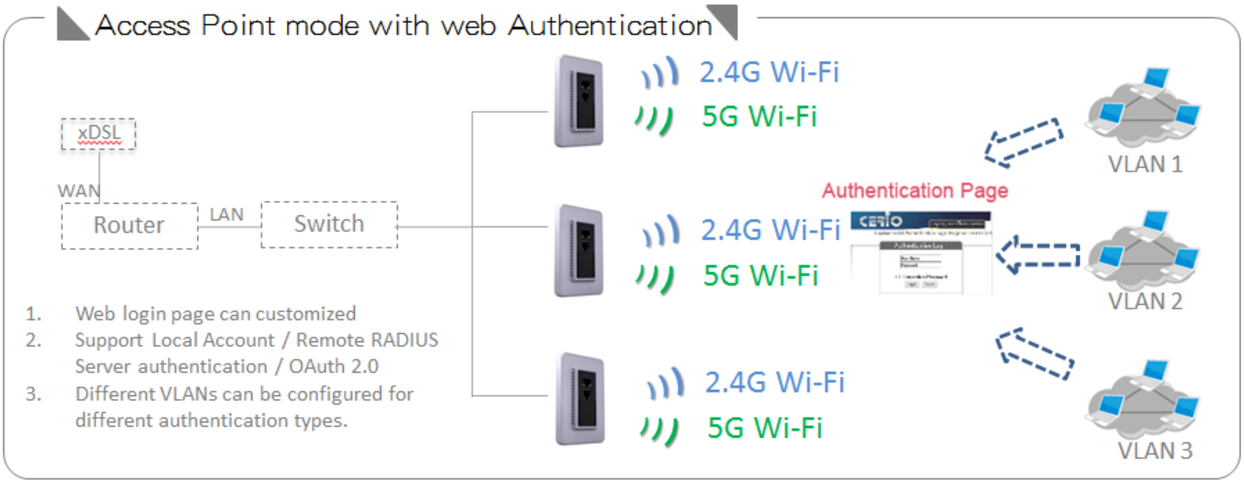


Mode: Access Point Mode

- ➢ It can be deployed as a traditional fixed wireless Access Point
- ➢ It allow wireless clients or Stations (STA) to access
- ➢ Supports DHCP Service, allowing for automated assigning of IP addresses to clients connecting to the network
- ➢ This enables the wireless interconnection of Access Point in a IEEE802.11 network and accepts wireless
- ➢ Support Captive Portal authentication.



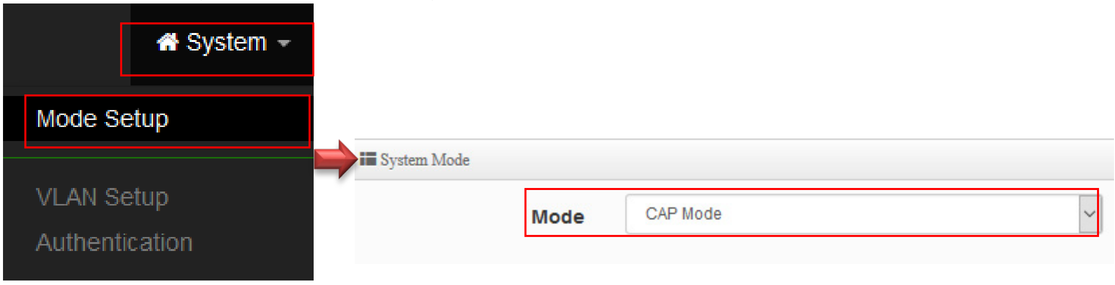
1. Wireless 2.4G support 802.11 bg/n
2. Wireless 5G support 802.11 an/ac
3. Support Wi-Fi roaming



1. Web login page can customized
2. Support Local Account / Remote RADIUS Server authentication / OAuth 2.0
3. Different VLANs can be configured for different authentication types.

CAP mode (Centralizes Access Point)

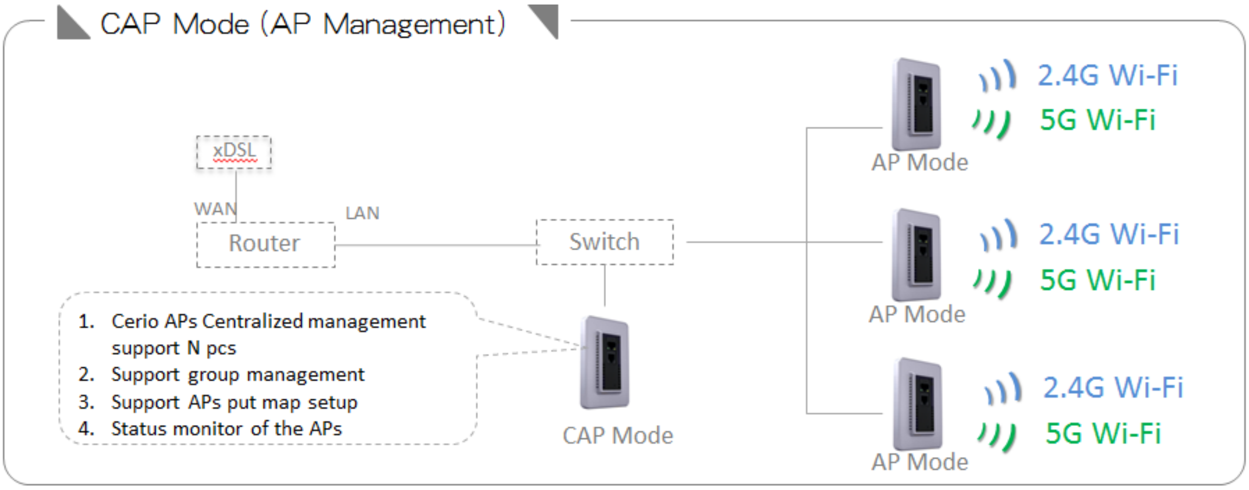
Please click on System ->Mode Setup and choose CAP Mode



Mode: CAP Mode

- Control Management of CenOS5.0 APs
- AP Management support 802.1Q VLAN infrastructure
- Centralized setting Access Point function and firmware upgrade.
- APs Group management for concept.

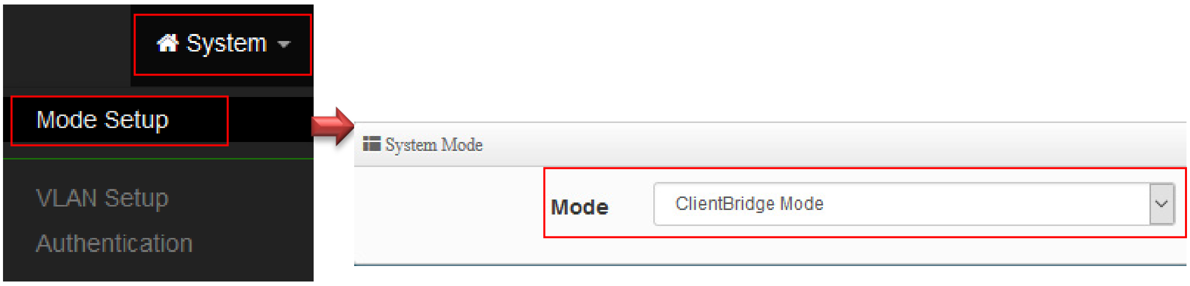
(Centralized management AP quantity of the quantity will vary depending on the product model. Please confirm the specification of the product)



1. Cerio APs Centralized management support N pcs
2. Support group management
3. Support APs put map setup
4. Status monitor of the APs

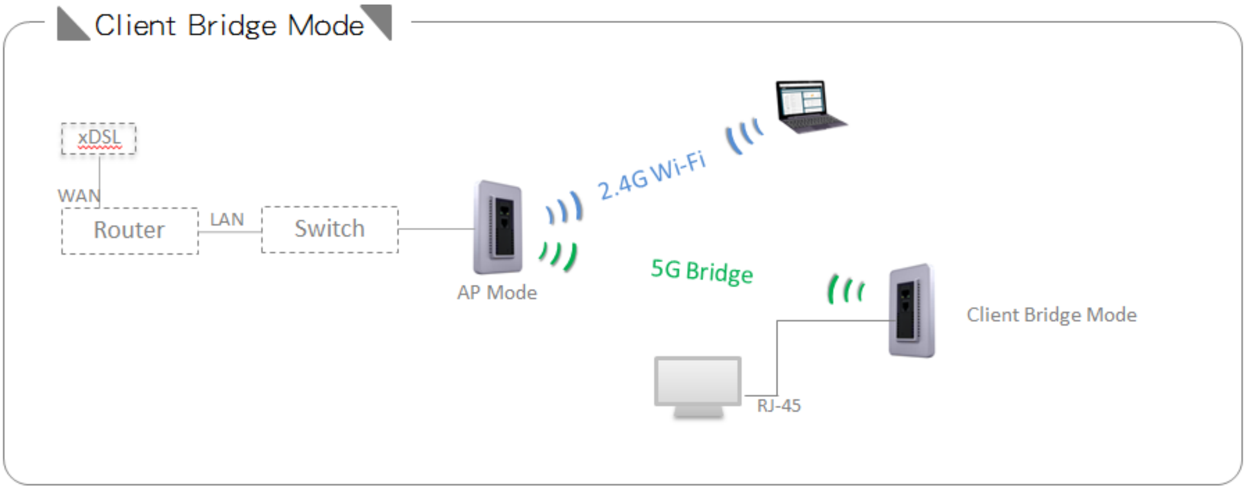
Client Bridge + Repeater Mode

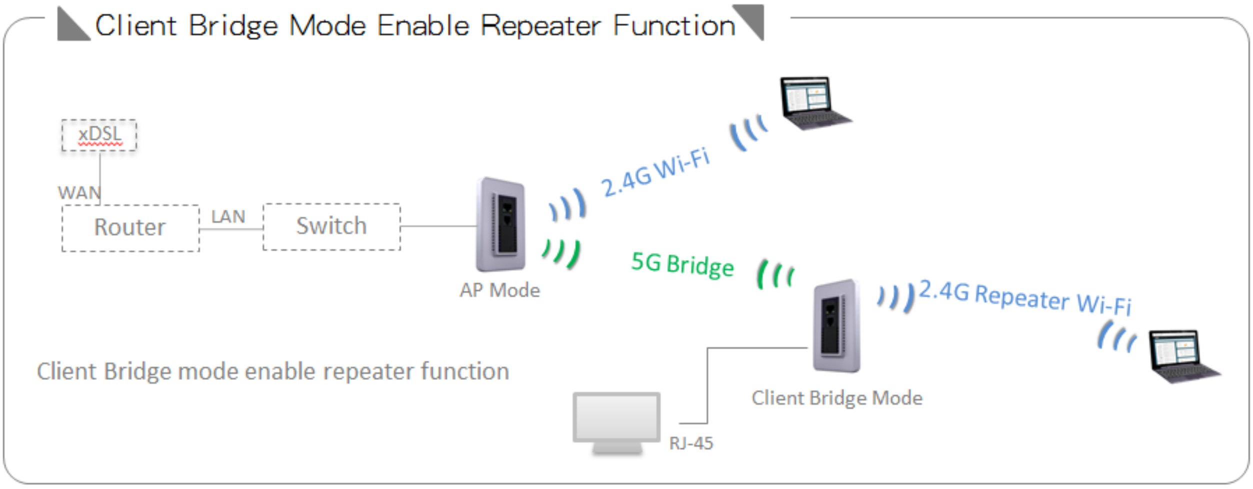
Please click on System ->Mode Setup and choose Client Bridge Mode



Mode: ClientBridge Mode

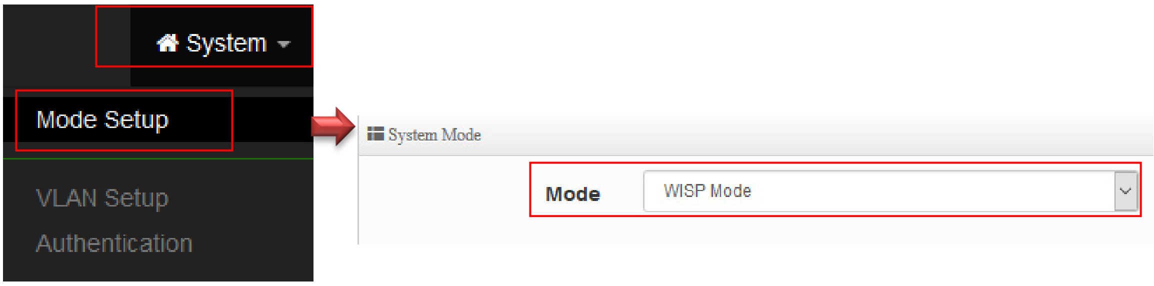
- It can be used as a Client Bridge + Repeater AP to receive wireless signals over last mile applications, helping WISPs deliver wireless broadband Internet service to new residential and business customers
- In this mode, the AP is enabled with DHCP Server functions. The wired clients of the AP are in the same subnet from Main Base Station and it accepts wireless connections from client devices. You can disabled the repeater extending AP function, which will enable the "AP Client " function





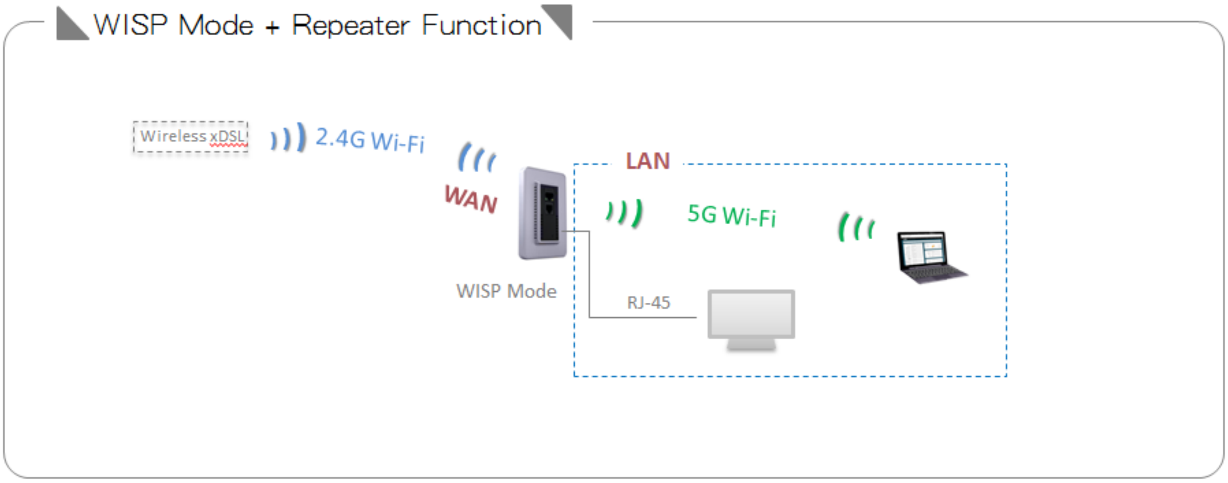
WISP + Repeater AP Mode

Please click on System ->Mode Setup and choose WISP Mode



Mode: WISP Mode

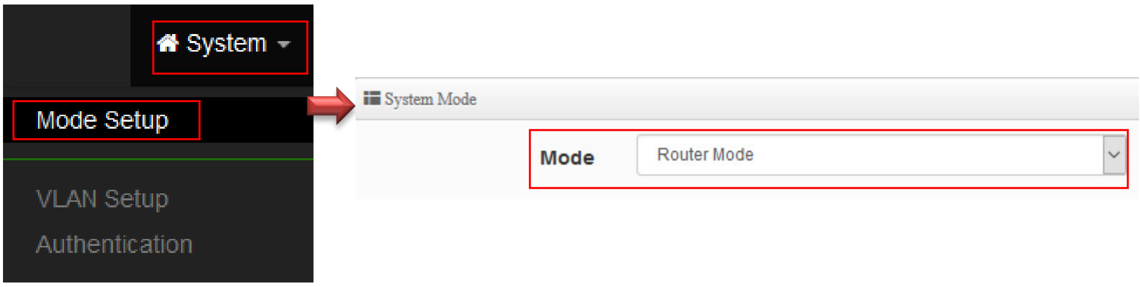
- It can be used as an WISP/Outdoor Customer Premises Equipment (CPE) to receive wireless signals over last mile application, helping WISPs deliver wireless broadband Internet service to residents and business customers
- In the WISP (CPE) mode, the CenOS 5.0 AP is a gateway enabled with NAT and DHCP Server functions. The wired clients connected to DT-300N are in different subnet from those connected to Main Base Station, and, in WISP (CPE) mode, it does not accept wireless association from wireless clients.



Router AP Mode

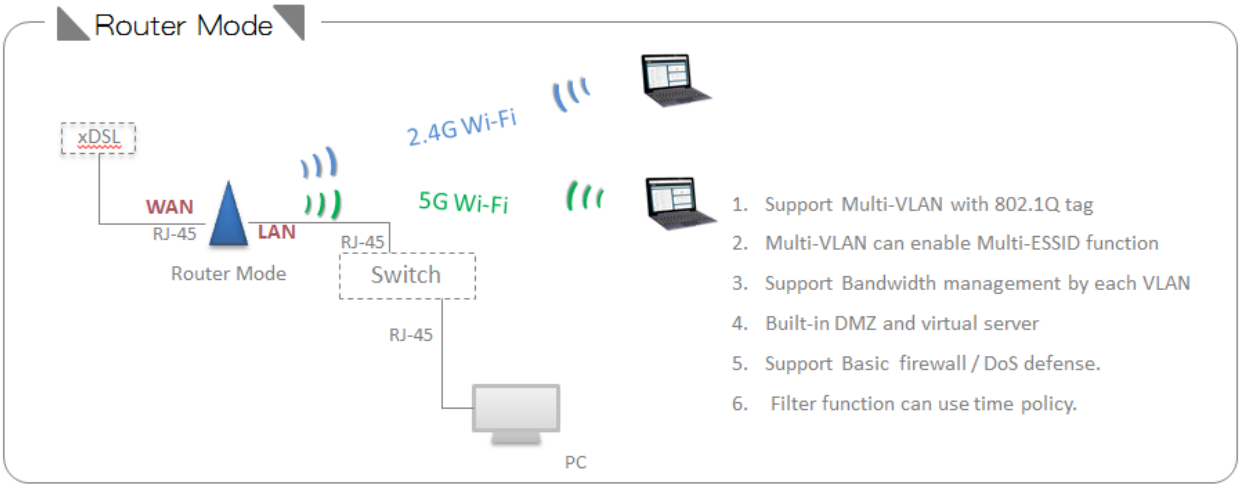
Notice	Not every product has a support routing mode. Please confirm the specification of the product.

Please click on System ->Mode Setup and choose Router Mode



Mode: Router Mode

- Router AP with 802.1Q tag VLAN, can use multi-ESSID with VLAN Tag
- Router AP mode support Bandwidth management / virtual server / DMZ / Firewall / Basic DoS defense.

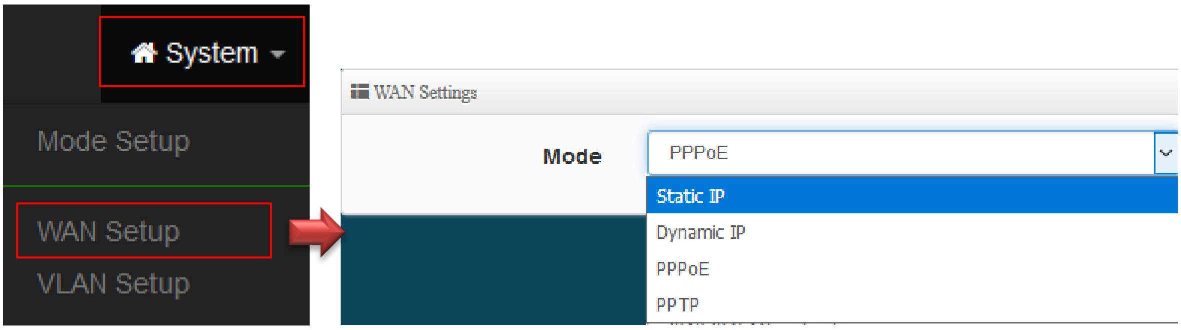


1. Support Multi-VLAN with 802.1Q tag
2. Multi-VLAN can enable Multi-ESSID function
3. Support Bandwidth management by each VLAN
4. Built-in DMZ and virtual server
5. Support Basic firewall / DoS defense.
6. Filter function can use time policy.

3. System Configuration

3.1 WAN Setup

Used to operate in **Router** and **WISP** mode, When change to **<u>Router</u> or <u>WISP Mode</u>** then WAN function can choose set Dynamic IP / Static IP / PPPoE and PPTP type。

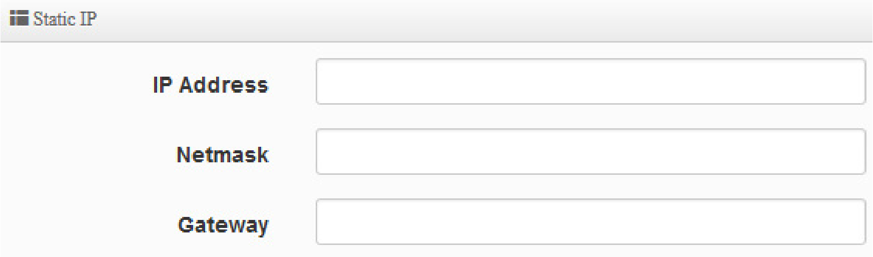


WAN Settings

Mode: PPPoE

- Static IP
- Dynamic IP
- PPPoE
- PPTP

➢ **Static IP:** Users can manually setup the WAN IP address with a static IP provided by WISP.

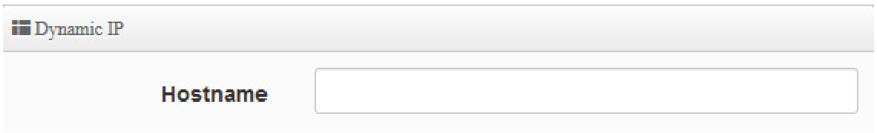


Static IP

IP Address	
Netmask	
Gateway	

- **IP Address:** The IP address of the WAN port.
- **IP Netmask:** The Subnet mask of the WAN port.
- **IP Gateway:** The default gateway of the WAN port.

➢ **Dynamic IP:** Please consult with WISP for correct wireless settings to associate with WISP AP before a dynamic IP, along with related IP settings. If IP Address is not assigned, please double check with your wireless settings and ensure successful association. Also, you may go to "**WAN Information**" in the Overview page to click ***Release*** button to release IP address and click ***Renew*** button to renew IP address again.

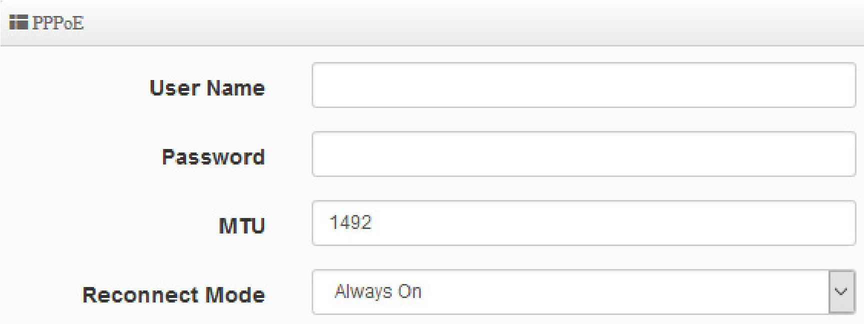


Dynamic IP

Hostname	

- **Hostname :** The Hostname of the WAN port

➢ **PPPoE:** To create wireless PPPoE WAN connection to a PPPoE server in network.

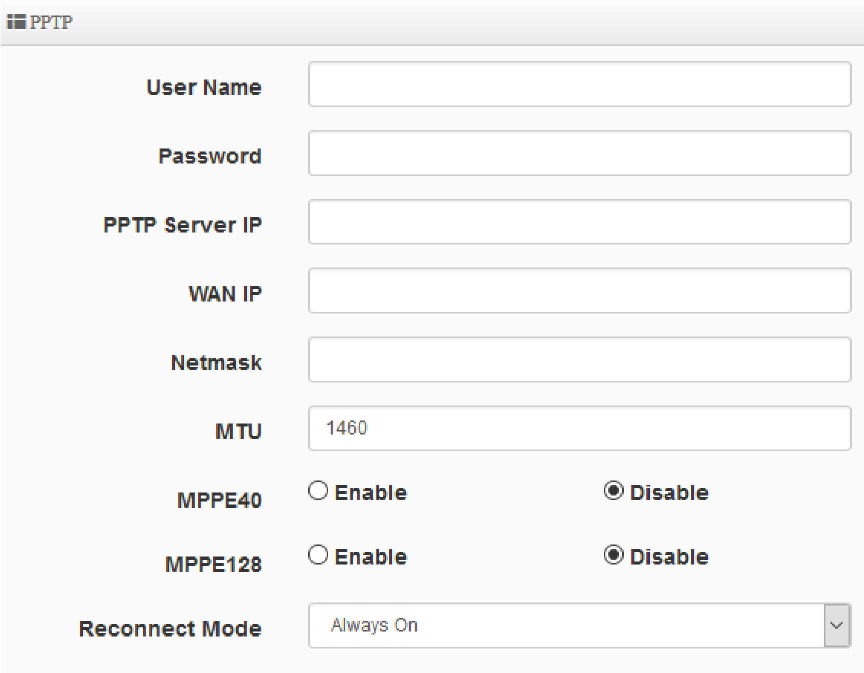


PPPoE

User Name	
Password	
MTU	1492
Reconnect Mode	Always On

- **User Name :** Enter User Name for PPPoE connection
- **Password :** Enter Password for PPPoE connection.
- **MTU:** By default, MTU is set to **1492** bytes. MTU stands for Maximum Transmission Unit. Consult with WISP for a correct MTU setting.
- **Reconnect Mode:** Administrator can select three functions for Always On / On Demand / Manual.
  - ✓ **Always On:** A connection to Internet is always maintained.
  - ✓ **On Demand** ： A connection to Internet is made as needed.
  - ✓ **Manual** ： Click the “**Connect**” button on “**WAN Information**” in the Overview page to connect to the Internet.

➢ **PPTP:** The Point-to-Point Tunneling Protocol (PPTP) mode enables the implementation of secure multi-protocol Virtual Private Networks (VPNs) through public networks.



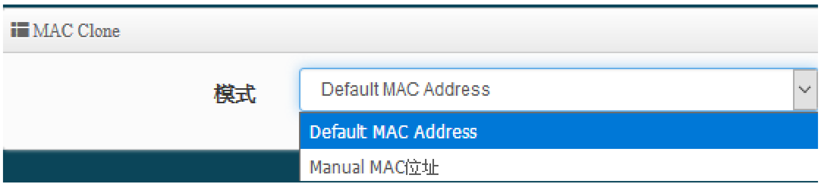
PPTP

User Name		
Password		
PPTP Server IP		
WAN IP		
Netmask		
MTU	1460	
MPPE40	○ Enable	● Disable
MPPE128	○ Enable	● Disable
Reconnect Mode	Always On	

- **User Name:** Enter account for PPTP.
- **Password:** Enter user name account used password for PPTP.
- **PPTP Server IP:** Enter remote IP address of PPTP Server.

- **WAN IP:** The IP address of the WAN port.
- **Netmask:** The Subnet mask of the WAN port.
- **MTU:** By default, it's **1460** bytes. MTU stands for Maximum Transmission Unit. Consult with WISP for a correct MTU setting.
- **MPPE40/128:** Microsoft Point-to-Point Encryption (MPPE) encrypts data in Point-to-Point Protocol (PPP)-based dial-up connections or Point-to-Point Tunneling Protocol (PPTP) virtual private network (VPN) connections. **128-bit** key (strong) and **40-bit** key (standard) MPPE encryption schemes are supported. MPPE provides data security for the PPTP connection that is between the VPN client and the VPN server.
- **Reconnect Mode:** Administrator can select three function for Always On / On Demand / Manual.
  - ✓ **Always On:** A connection to Internet is always maintained.
  - ✓ **On Demand：** A connection to Internet is made as needed.
  - ✓ **Manual：** Click the "**Connect**" button on "**WAN Information**" in the Overview page to connect to the Internet.

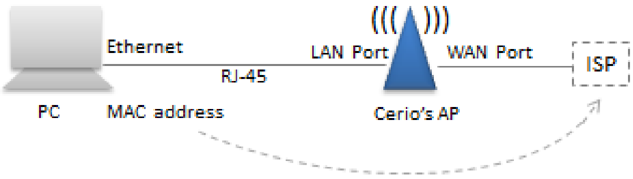
➢ **MAC Clone：** The MAC address is a 12-digit HEX code uniquely assigned to hardware as identification. Some ISPs require you to register a MAC address in order to access to Internet. If not, you could use default MAC or clone MAC from a PC.



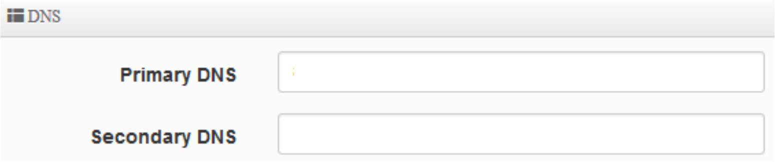
MAC Clone

模式: Default MAC Address

- **Default MAC Address：Default MAC Address:** Keep the default MAC address of WAN port on the system.
- **Manual MAC 位址 ：**Enter the MAC address registered with your ISP.



➢ **DNS :** Check "No Default DNS Server" or "Specify DNS Server IP" radial button as desired to set up system DNS.

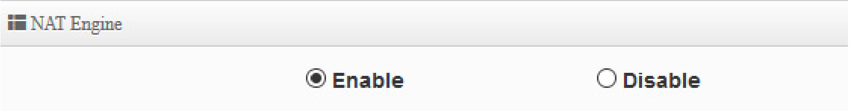


DNS

Primary DNS:

Secondary DNS:

- **NAT Engine:** NAT routing acceleration engine, mainly to speed up the packet transfer between WAN and VLAN conversion speed. But, if enable NAT engine then some firewall function will be invalid(ex. DoS defense).
  System default is enable, if administrator need use firewall function then recommend disable it.



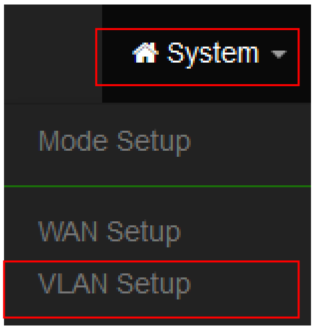
NAT Engine

● Enable ○ Disable

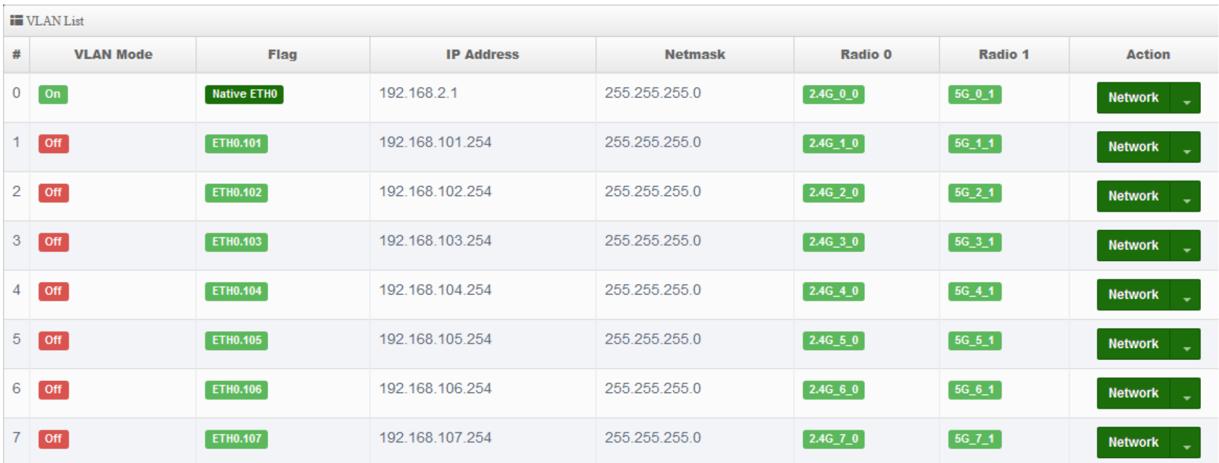
After the above function is setup, please click "Save" button and reboot system will apply new profile and working normally.

3.2 VLAN Setup

Used to operate in **Router** / **Access Point and CAP** mode **(CAP mode no Wireless function),** Support multi-VLAN service (*Not every product has support multi-VLAN. Please confirm the specification of the product.*)﹐default enable an VLAN, each VLAN support 802.1Q standard.



Click VLAN Setup function will display VLAN list, each VLAN is an 802.1Q standard. Administrator can enable or disable multi-VLAN in list. At least one VLAN enabled



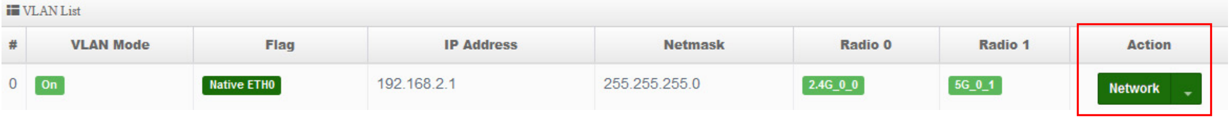
VLAN List

#	VLAN Mode	Flag	IP Address	Netmask	Radio 0	Radio 1	Action
0	On	Native ETH0	192.168.2.1	255.255.255.0	2.4G_0_0	5G_0_1	Network
1	Off	ETH0.101	192.168.101.254	255.255.255.0	2.4G_1_0	5G_1_1	Network
2	Off	ETH0.102	192.168.102.254	255.255.255.0	2.4G_2_0	5G_2_1	Network
3	Off	ETH0.103	192.168.103.254	255.255.255.0	2.4G_3_0	5G_3_1	Network
4	Off	ETH0.104	192.168.104.254	255.255.255.0	2.4G_4_0	5G_4_1	Network
5	Off	ETH0.105	192.168.105.254	255.255.255.0	2.4G_5_0	5G_5_1	Network
6	Off	ETH0.106	192.168.106.254	255.255.255.0	2.4G_6_0	5G_6_1	Network
7	Off	ETH0.107	192.168.107.254	255.255.255.0	2.4G_7_0	5G_7_1	Network

- **VLAN Mode**：Display on/off for the VLAN network.
- **Flag**：Display master VLAN and VLAN Tag No. information.
- **IP Address**：Display IP Address for VLAN Network.
- **NetMask**：Display IP netmask.
- **Radio 0/1**：Display radio 2.4G or 5GHz SSID name (Depending on 11ac or 11n model)
  (Not every product has support 5GHz(Radio 1). Please confirm the specification of the product.)

- **Action：**The button can set VLAN network functions Network ⌄ and radio functions Network ⌄

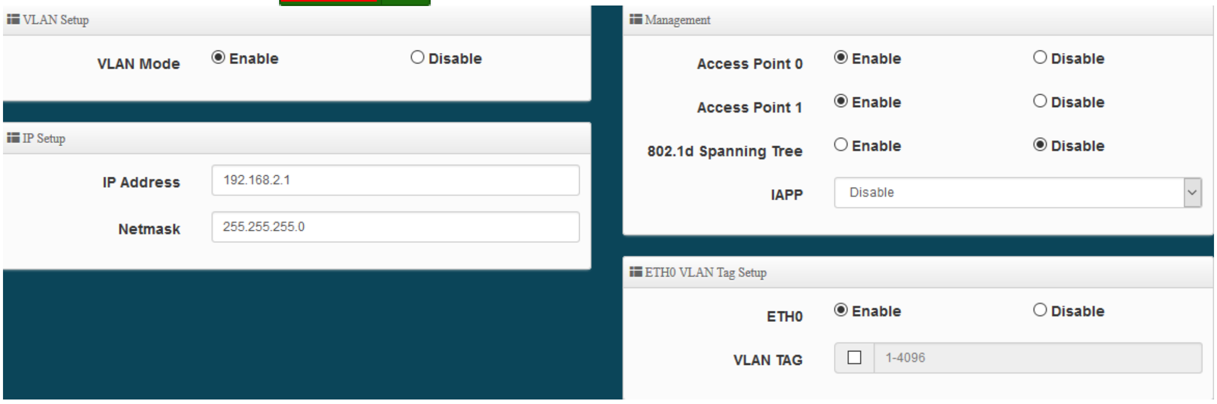
3.2.1 Network Button



VLAN List

#	VLAN Mode	Flag	IP Address	Netmask	Radio 0	Radio 1	Action
0	On	Native ETH0	192.168.2.1	255.255.255.0	2.4G_0_0	5G_0_1	Network ⌄

Administrator can click Network ⌄ button to set VLAN network functions.



VLAN Setup

VLAN Mode ● Enable ○ Disable

IP Setup

IP Address 192.168.2.1

Netmask 255.255.255.0

Management

Access Point 0 ● Enable ○ Disable

Access Point 1 ● Enable ○ Disable

802.1d Spanning Tree ○ Enable ● Disable

IAPP Disable

ETH0 VLAN Tag Setup

ETH0 ● Enable ○ Disable

VLAN TAG □ 1-4096

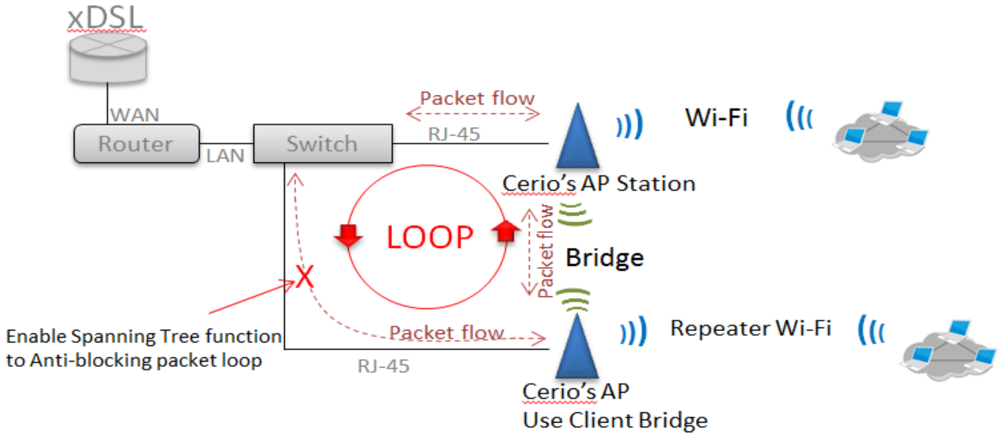
- **VLAN Mode：**Administrator can select Enable or disable for the VLAN Network.

Notice	At least one VLAN must always be enabled

- **IP Mode：**Administrator can select enable or disable function for VLAN IP.
- **IP Address/ NetMask：**Administrator can set IP address and netmask for the VLAN.
- **Access Point 0：**Administrator can Enable or Disable 2.4G Radio.
- **Access Point 1：**Administrator can Enable or Disable 5G Radio.

  (Not every product has support 5GHz(Radio 1). Please confirm the specification of the product.)

- **Default Gateway:** Set Gateway IP address. **(In Access Point mode)**
- **DNS:** Set DNS IP address. **(In Access Point mode)**
- **802.1d Spanning Tree :** The Spanning Tree Protocol, which is also referred to as STP, is defined in the IEEE Standard 802.1d



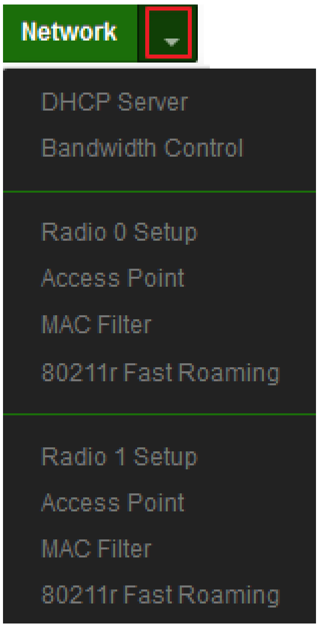
- ✓ **Control Port:** Administrator can select one of the VLAN as managed AP. (In Access Point mod)
- ✓ **IAPP 漫遊：**Administrator can select radio 2.4G or 5G for IAPP roaming.*(the IAPP condition must use WPA2-PSK Wi-Fi security and AES algorithm)*
- ✓ **ETH # VLAN Tag Setup:** Set the Ethernet port can to access which tags. *(The number of Ethernet ports will vary depending on the model. Please confirm the specification of the product.)*

After the above function is setup, please click "**Save**" button and **reboot** system will apply new profile and working normally.

3.2.2 Network Pull-down menu

Administrator can set DHCP Server and 2.4/5G security for the access point and set 802.11r fast roaming.

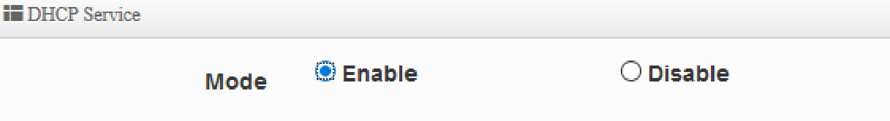
Please click the pull-down button.



Notice	Radio 1 (5G Wi-Fi) Setup, not every product has support 5GHz(Radio 1). Please confirm the specification of the product.

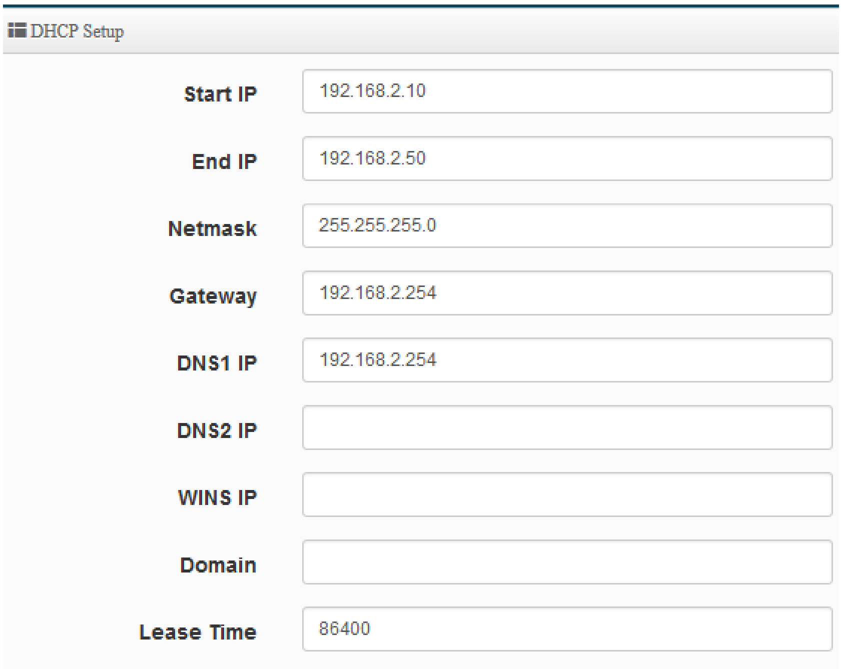
# DHCP Server

Administrator can select enable / disable the function



DHCP Service

Mode ● Enable ○ Disable

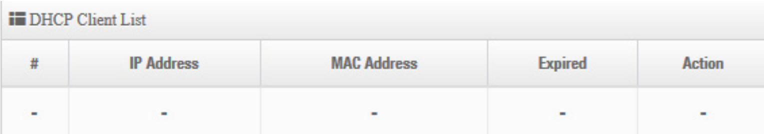


DHCP Setup

Start IP	192.168.2.10
End IP	192.168.2.50
Netmask	255.255.255.0
Gateway	192.168.2.254
DNS1 IP	192.168.2.254
DNS2 IP	
WINS IP	
Domain	
Lease Time	86400

- **Start IP :** Set Start IP for DHCP Service.
- **End IP :** Set End IP for DHCP Service.
- **Netmask: Set IP Netmask, the default is 255.255.255.0**
- **Gateway: Set Gateway IP for DHCP Service.**
- **DNS(1-2) IP :** Set DNS IP for DHCP Service.
- **WINS IP :** Enter IP address of the Windows Internet Name Service (WINS) server; this is optional.
- **Domain :** Enter the domain name for this network.
- **Lease Time :** The IP addresses given out by the DHCP server will only be valid for the duration specified by the lease time. Increasing the time ensure client operation without interruptions, but could introduce potential conflicts. Lowering the lease time will avoid potential address conflicts, but might cause more interruptions to the client while it will acquire new IP addresses from the DHCP server. Default is **86400** seconds
- **DHCP Client List**

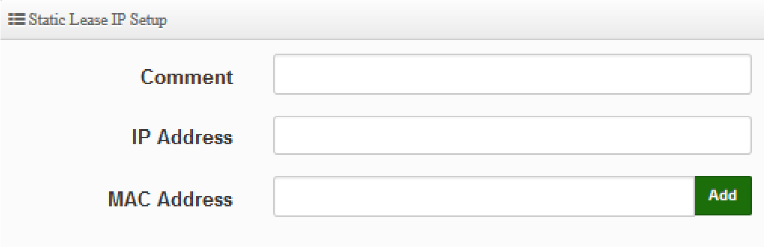
  Administrator can view IP address used status of client users on each DHCP Server.



DHCP Client List

#	IP Address	MAC Address	Expired	Action
-	-	-	-	-

- **Static Lease IP List:** Administrator can set be delivered fixed IP address to the users.

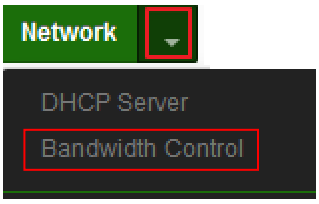


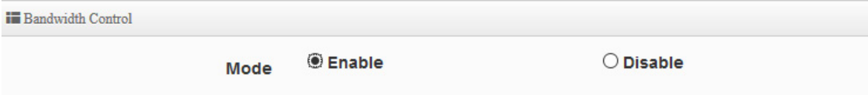
Static Lease IP Setup

Comment	
IP Address	
MAC Address	

# Bandwidth Control

Administrators can set bandwidth limit the max/min bandwidth of the Wi-Fi users, Bandwidth control can set IP/MASK , IP Range, Port(Service), SIP, RTP/RTSP and WEB.

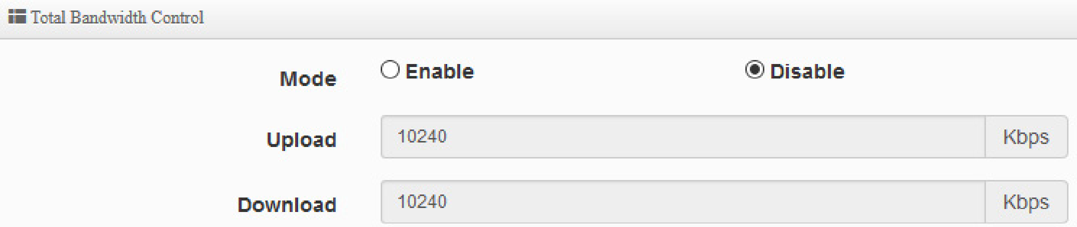




Bandwidth Control

Mode ● Enable ○ Disable

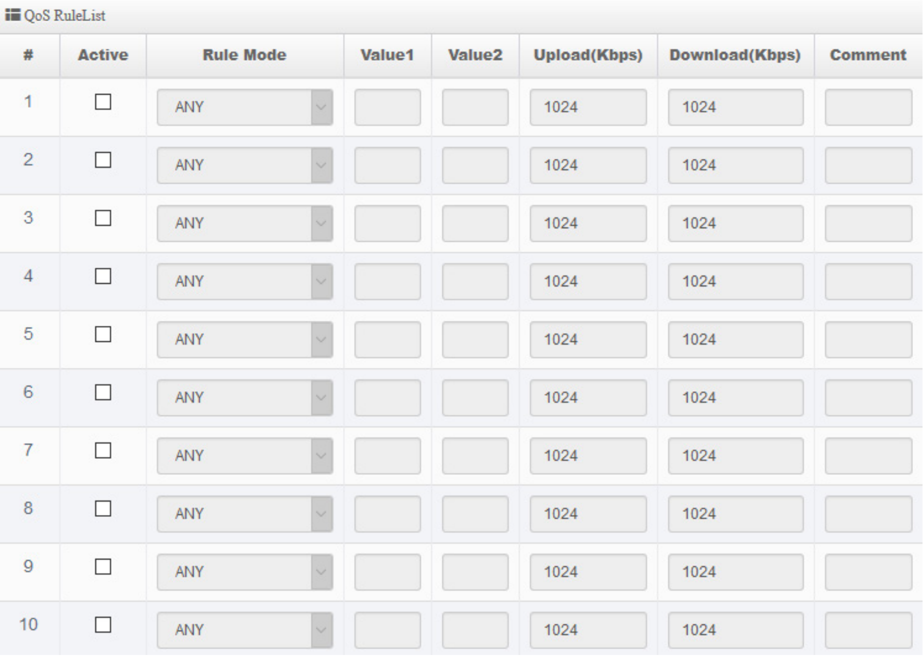
Administrator can enable or disable the function.



Total Bandwidth Control

Mode	○ Enable ● Disable
Upload	10240 Kbps
Download	10240 Kbps

- ➢ Administrator can set total bandwidth used limit in VLAN.



QoS RuleList

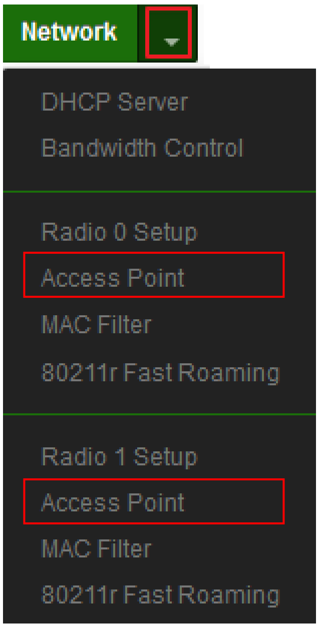
#	Active	Rule Mode	Value1	Value2	Upload(Kbps)	Download(Kbps)	Comment
1	□	ANY			1024	1024	
2	□	ANY			1024	1024	
3	□	ANY			1024	1024	
4	□	ANY			1024	1024	
5	□	ANY			1024	1024	
6	□	ANY			1024	1024	
7	□	ANY			1024	1024	
8	□	ANY			1024	1024	
9	□	ANY			1024	1024	
10	□	ANY			1024	1024	

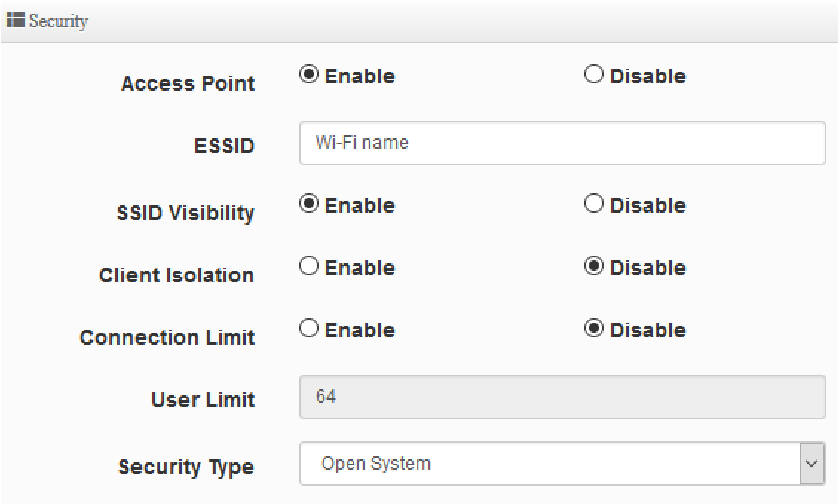
- ➢ **QoS Rule List:** Administrator can set bandwidth limit by IP/MASK, IP Range, Port(Service), SIP, RTP/RTSP, WEB protocol , each VLAN can set 10 bandwidth management rule.

# Radio 0(2.4G)/1(5G) Access Point Setup

Notice	Radio 1 (5G Wi-Fi) Setup, not every product has support 5GHz(Radio 1). Please confirm the specification of the product.

Administrator can Enable or Disable radio 0/1 (2.4/5G) Wi-Fi. If radio 0/1 (2.4/5G) are enabled, administrators can set the SSID and security for the 2.4/5G access point.

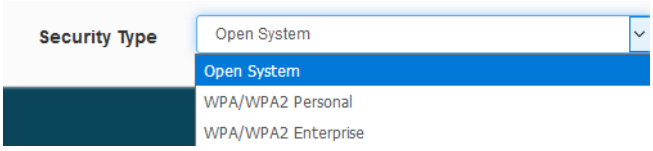




Security

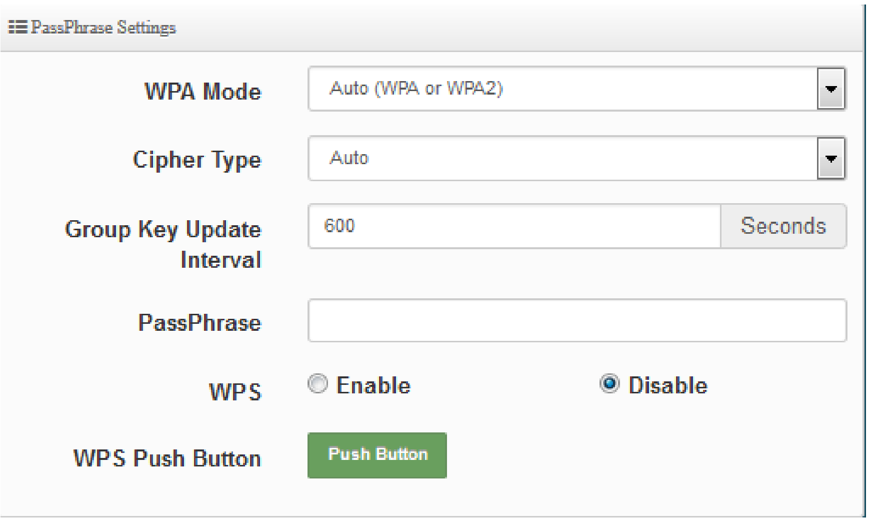
Access Point	● Enable	○ Disable
ESSID	Wi-Fi name	
SSID Visibility	● Enable	○ Disable
Client Isolation	○ Enable	● Disable
Connection Limit	○ Enable	● Disable
User Limit	64	
Security Type	Open System	

- ➢ **Access Point:** Administrator can Enable or Disable the radio 0/1 (2.4G/5G).
- ➢ **ESSID:** Administrator can set Wi-Fi SSID name
- ➢ **SSID Visibility:** Administrator can select Enable or Disable the Visibility.
- ➢ **Client Isolation:** Enable or Disable the client isolation function.
- ➢ **Connection Limit:** Administrator can select Enable or Disable WiFi connection Limit.
- ➢ **User Limit:** If select enable of the connection Limit function, administrator can set users connection limit.(Recommended 2.4G/5G limit 40/60 Wi-Fi Users)
- ➢ **Security Type:** Select the desired security type from the drop-down list; the options are Open System, WPA-PSK/WPA2-PSK and WPA/WPA2-Enterprise.



Security Type: Open System

- **Open System:** Data is not unencrypted during transmission when this option is selected.
- **WPA-PSK/WPA2-PSK Personal:** WPA/WPA2 is short for W-Fi Protected Access-Pre-Shared Key. WPA/WPA2 uses the same encryption way with WPA, and the only difference between them is that WPA/WPA2 recreates a simple shared key, instead of using the user’s certification.



PassPhrase Settings

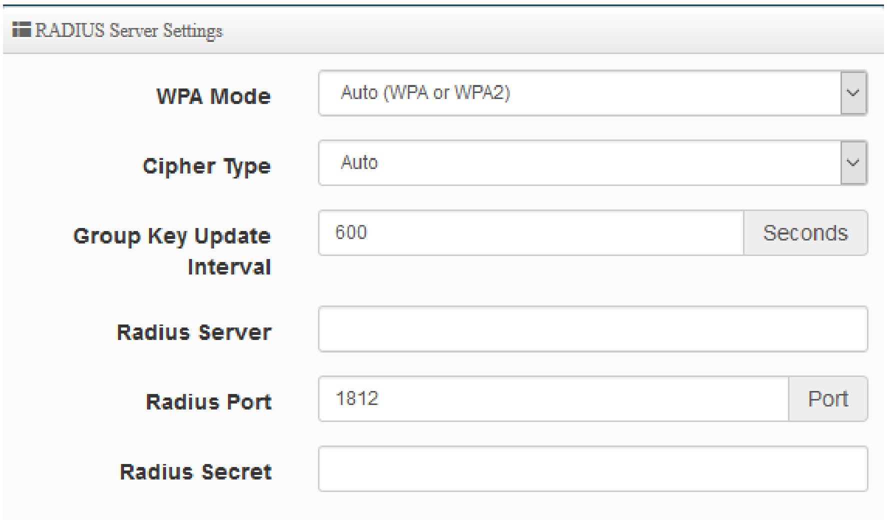
WPA Mode	Auto (WPA or WPA2)
Cipher Type	Auto
Group Key Update Interval	600 Seconds
PassPhrase	
WPS	○ Enable ● Disable
WPS Push Button	Push Button

- ✓ **WPA Mode:** Administrator can select security for Auto or only WPA or only WPA2.
- ✓ **Cipher Type:** Administrator can select use AES or TKIP with WPA / WPA2 encryption method.

  AES is short for "**Advanced Encryption Standard**", The AES cipher is specified as a number of repetitions of transformation rounds that convert the input plaintext into the final output of ciphertext. Each round consists of several processing steps, including one that depends on the encryption key. A set of reverse rounds are applied to transform ciphertext back into the original plaintext using the same encryption key.

  TKIP is short for "**Temporal Key Integrity Protocol**", TKIP scrambles the keys using a hashing algorithm and, by adding an integrity-checking feature, ensures that the keys haven't been tampered with.
- ✓ **Group Key Update Interval**: The time interval is for re-keying GTK (broadcast/multicast encryption keys) in seconds. Enter the time-length required; the default time is 600 seconds.
- ✓ **Pass Phrase:** Enter the ESSID pass phrase.
- ✓ **WPS:** Administrator can used WPS function to link WiFi client. If enabled, administrator can click the WPS Push Button.

- **WPA/WAP2-Enterprise**



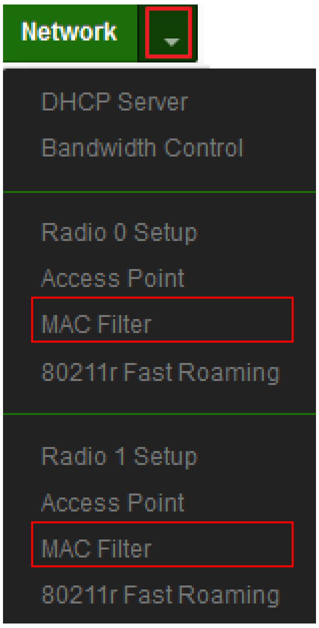
RADIUS Server Settings

WPA Mode	Auto (WPA or WPA2)
Cipher Type	Auto
Group Key Update Interval	600 Seconds
Radius Server	
Radius Port	1812 Port
Radius Secret	

- **Radius Server**：Enter the IP address of the Authentication RADIUS server.
- **Radius Port:** The port number used by Authentication RADIUS server. Use the default 1812 or enter port number specified.
- **Radius Secret:** The secret key for system to communicate with Authentication RADIUS server. Support 1 to 64 characters.

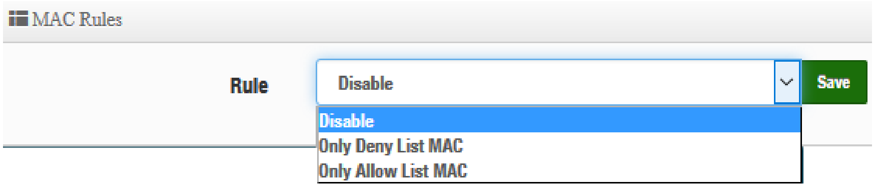
After the above function is setup, please click "**Save**" button and **reboot** system will apply new profile and working normally.

# MAC Filter



Notice	Radio 1 (5G Wi-Fi) Setup, not every product has support 5GHz(Radio 1). Please confirm the specification of the product.

Administrator can set allow or reject Wi-Fi users connection access point.



MAC Rules

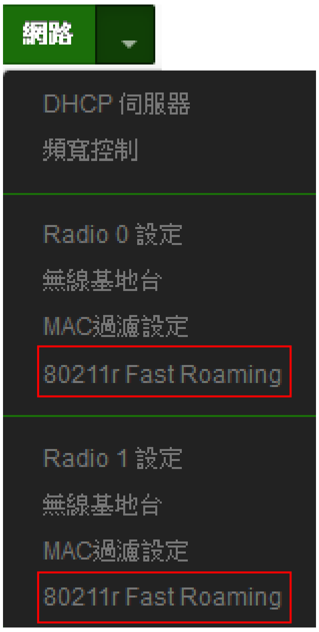
Rule: Disable

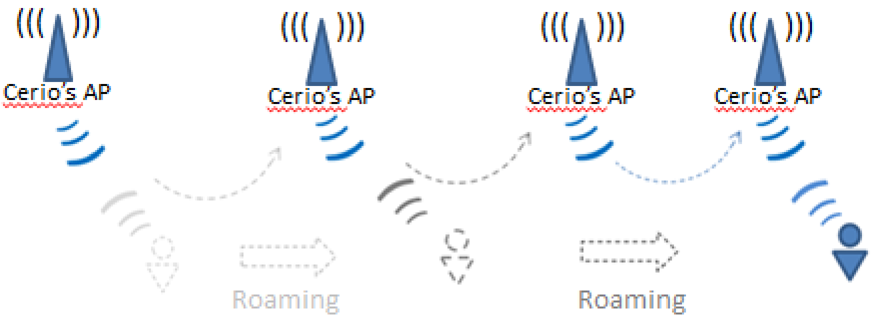
(1) **Only Deny List MAC**： Administrator can add wireless users MAC address in MAC list. The access point will deny connection in MAC address list.

(2) **Only Allow List MAC**： Administrator can add wireless users MAC address in MAC list. The access point will Allow connection in MAC address list.

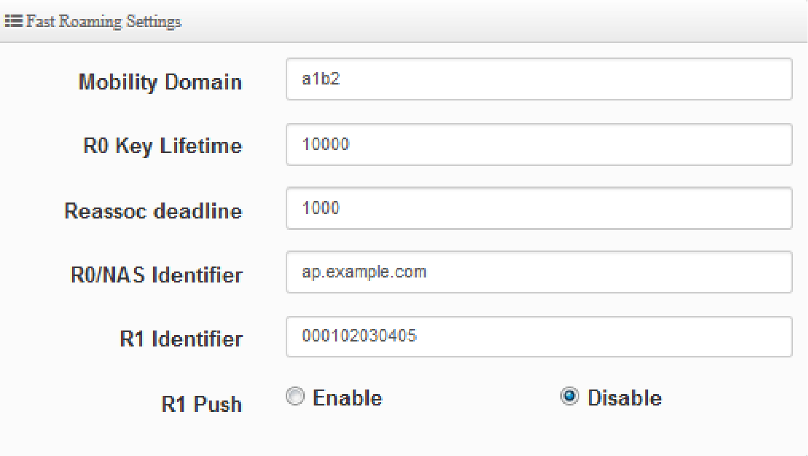
After the above function is setup, please click "**Save**" button and **reboot** system will apply new profile and working normally.

# 802.11r/802.11k Fast Roaming





The dual band Access Point supports 802.11r/802.11k function for 2.4G and 5G radio. 802.11r, which is the IEEE standard for fast roaming, introduces a new concept of roaming where the initial handshake with the new AP is done even before the client roams to the target AP.



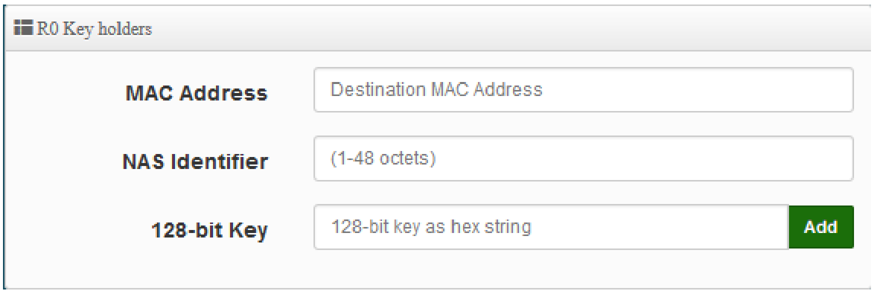
Fast Roaming Settings

Mobility Domain	a1b2
R0 Key Lifetime	10000
Reassoc deadline	1000
R0/NAS Identifier	ap.example.com
R1 Identifier	000102030405
R1 Push	○ Enable ● Disable

- **Mobility Domain:** MDID is used to indicate a group of APs (within an ESS, i.e., sharing the same SSID) between which a STA can use Fast BSS Transition. Please enter 2-octet identifier as a hex string.
- **R0 Key Lifetime:** Default lifetime of the PMK-RO in minutes, the default is 10000, administrator can setting 1~65535.
- **Reassoc deadline:** Reassociation deadline in time units (TUs / 1.024 ms; range 1000~65535). The default is 1000.
- **R0/NAS Identifier:** PMK-R0 Key Holder identifier. When using IEEE 802.11r, nas_identifier must be set and must be between 1 and 48 octets long.
- **R1 Identifier:** PMK-R1 Key Holder identifier 6-octet identifier as a hex string.
- **R1 Push:** Administrator can select Enable or disable. If enable the function will automatically sent the R1 Key.

R0 Key Holder:

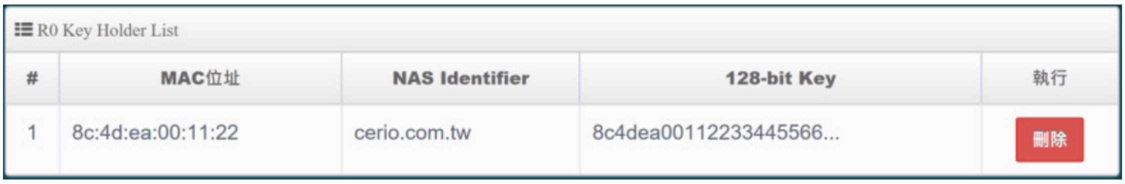
To enable roaming between multiple AP devices, AP1 must key in the MAC Address of AP2, and AP2 must key in the MAC Address of AP1. The NAS Identifier and 128-bit Key should be identical in both AP settings. This will enable device roaming between the two Access Points.



R0 Key holders

MAC Address	Destination MAC Address
NAS Identifier	(1-48 octets)
128-bit Key	128-bit key as hex string [Add]

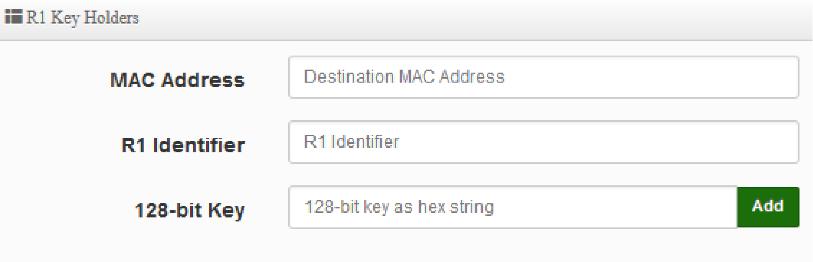
- **MAC Address:** Administrators must enter the MAC Address of other AP
- **NAS Identifier:** Enter 1~48 octets of network domain name.
- **128-bit Key:** Enter Shared Key of 128 bit.



R0 Key Holder List

#	MAC位址	NAS Identifier	128-bit Key	執行
1	8c:4d:ea:00:11:22	cerio.com.tw	8c4dea00112233445566...	刪除

R1 Key holders : Enter a unified set of R1 Key Holder identification certification.



R1 Key Holders

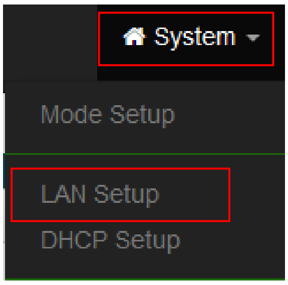
MAC Address	Destination MAC Address
R1 Identifier	R1 Identifier
128-bit Key	128-bit key as hex string [Add]

- **MAC Address:** Enter the main roaming device MAC address
- **R1 Identifier:** Enter Shared identifier.
- **128-bit Key:** Enter Shared Key of 128 bit.

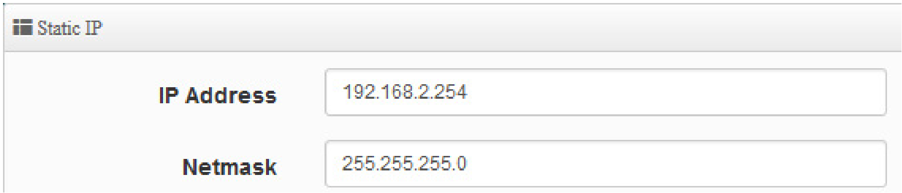
After the above function is setup, please click "**Save**" button and **reboot** system will apply new profile and working normally.

3.3 LAN Setup

Used to operate in Client Bridge and WISP Mode, If change to Client Bridge / WISP mode then administrator can set this mode of network IP address / DNS / DHCP forward / STP function. If change to WISP mode, administrator only set IP address and STP function.



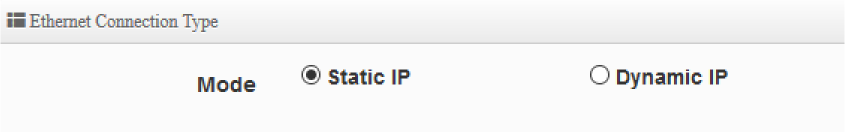
The following is the setting page for WISP mode, the main set IP address for network



Static IP

IP Address: 192.168.2.254
Netmask: 255.255.255.0

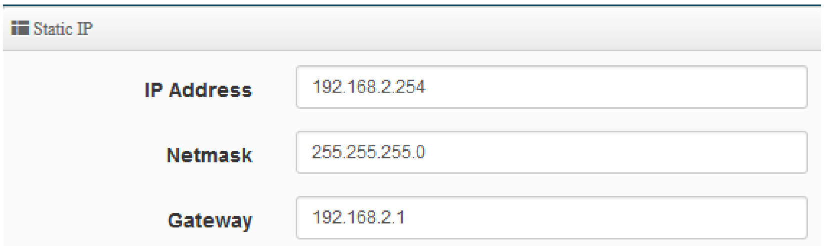
The following is the setting page for Client Bridge mode



Ethernet Connection Type

Mode ● Static IP ○ Dynamic IP

- **Mode:** Administrator can select the IP used Static or Dynamic IP address.
  - **Static IP:** ：Administrator can manual set for this IP address.



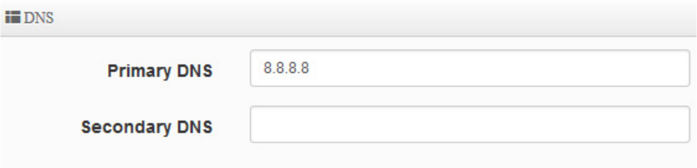
Static IP

IP Address: 192.168.2.254
Netmask: 255.255.255.0
Gateway: 192.168.2.1

- ✓ **IP address:** The IP address is 192.168.2.254
- ✓ **Netmask:** The default Netmask is 255.255.255.0
- ✓ **Gateway:** The default Gateway IP Address is 192.168.2.1, Please check your Gateway IP and change.

- **Dynamic IP:** The IP address is provided by DHCP server in the network environment.

➢ **DNS**: Enter IP address of domain name service.

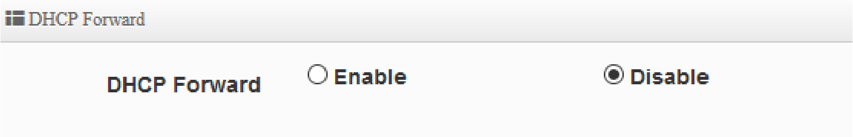


DNS

Primary DNS 8.8.8.8

Secondary DNS

➢ **DHCP Forward:** DHCP Forwarder is an agent relaying DHCP messages between different Ethernet subnets. If used client bridge mode and enable repeater function, and wireless client used IP address need get DHCP server of the Upper-layer device to assign then this function need enable.

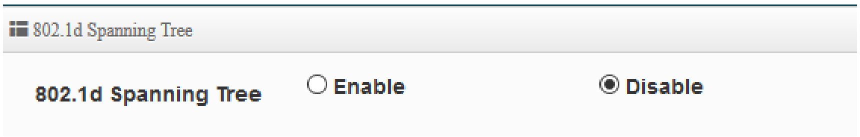


DHCP Forward

DHCP Forward ○ Enable ● Disable

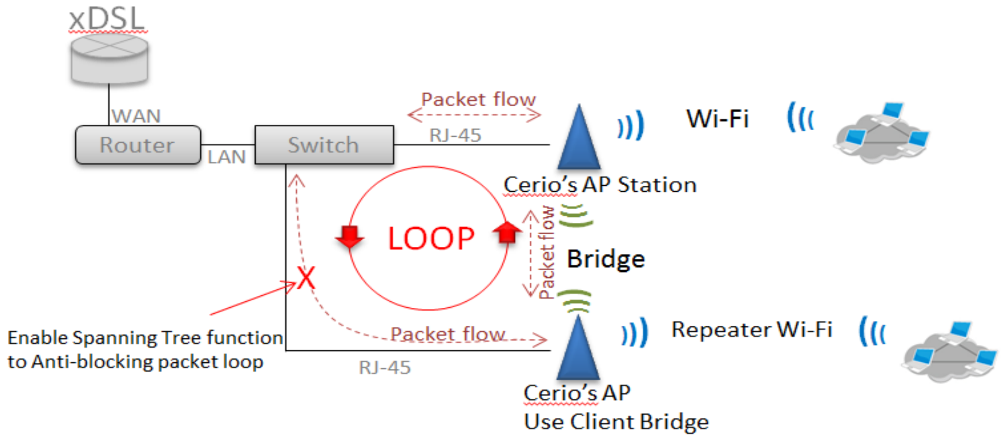
➢ **ETH # VLAN Tag Setup:** Set Ethernet port listen to specific VLAN tag

➢ **802.1d Spanning Tree**： The Spanning Tree Protocol, which is also referred to as STP, is defined in the IEEE Standard 802.1d



802.1d Spanning Tree

802.1d Spanning Tree ○ Enable ● Disable

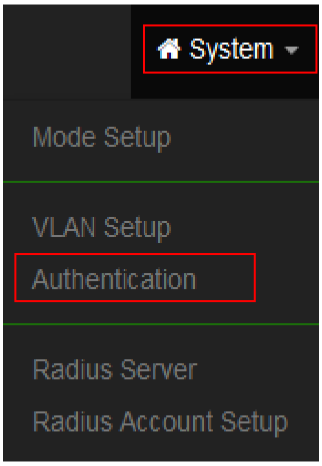


Enable Spanning Tree function to Anti-blocking packet loop

3.4 Authentication

This function used to operate in **Access Point** mode**,** the function is for Web Authentication. It supports authentication for local users / RADIUS Server / OAuth2.0 and Guest. The system supports in N VLANs with web authentication.

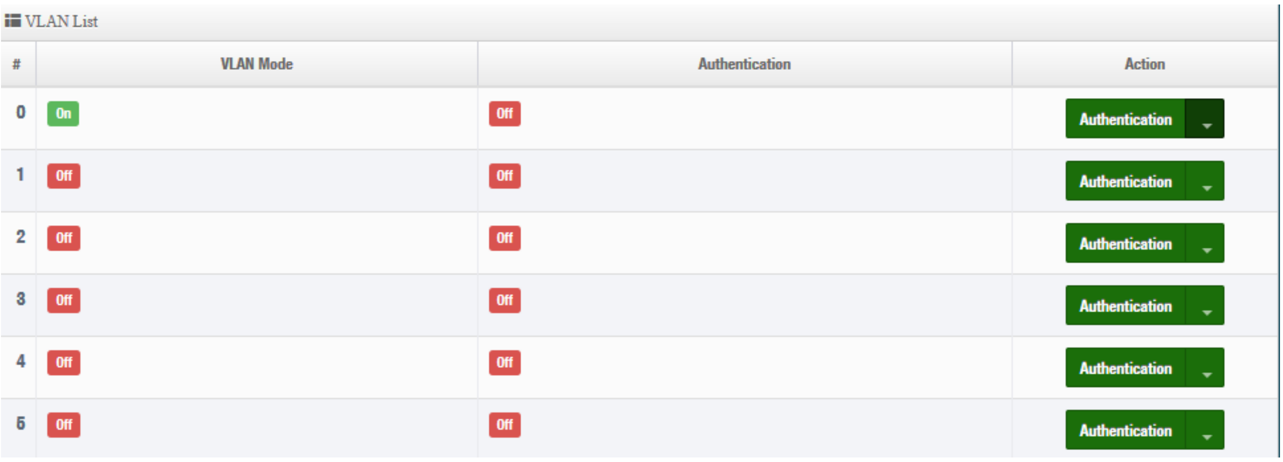
Please click on System -> Authentication



After administrator click Authentication button will display authentication list, the list base on VLAN list. The list number will vary depending on the model.

Notice

When enable web authentication function, please does make the Access Point can be connected to gateway. Please refer to 3.2 VLAN Setup. If the gateway IP address is set error then web authentication page will can't display.



VLAN List

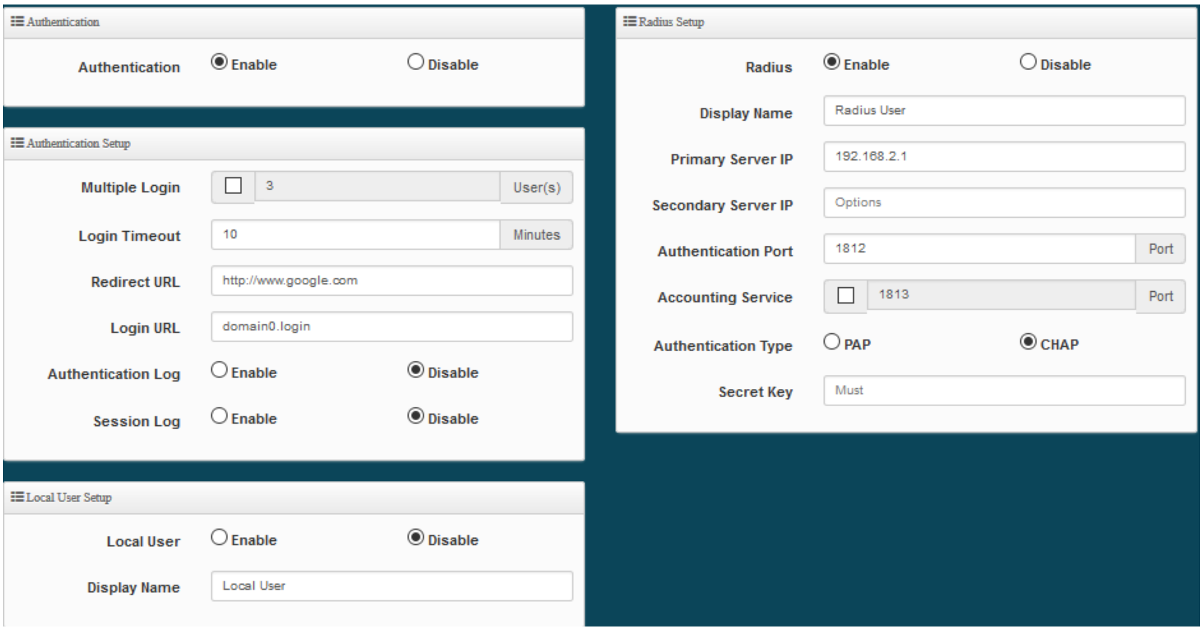
#	VLAN Mode	Authentication	Action
0	On	Off	Authentication
1	Off	Off	Authentication
2	Off	Off	Authentication
3	Off	Off	Authentication
4	Off	Off	Authentication
5	Off	Off	Authentication

- **#**：Display VLANs number.
- **VLAN Mode**：Displays VLAN on/off status. (Please refer to 3.2 VLAN Setup)
- **Authentication**：Displays VLAN# whether enable or disable web authentication.
- **Action**：The function has 2 buttons (Authentication and Dropdown)

※ Authentication Button

3.4.1 Enable Authentication function

：By clicking the Authentication button, administrator can enable or disable this function.



Authentication

Authentication ● Enable ○ Disable

Authentication Setup

Multiple Login ☐ 3 User(s)

Login Timeout 10 Minutes

Redirect URL http://www.google.com

Login URL domain0.login

Authentication Log ○ Enable ● Disable

Session Log ○ Enable ● Disable

Local User Setup

Local User ○ Enable ● Disable

Display Name Local User

Radius Setup

Radius ● Enable ○ Disable

Display Name Radius User

Primary Server IP 192.168.2.1

Secondary Server IP Options

Authentication Port 1812 Port

Accounting Service ☐ 1813 Port

Authentication Type ○ PAP ● CHAP

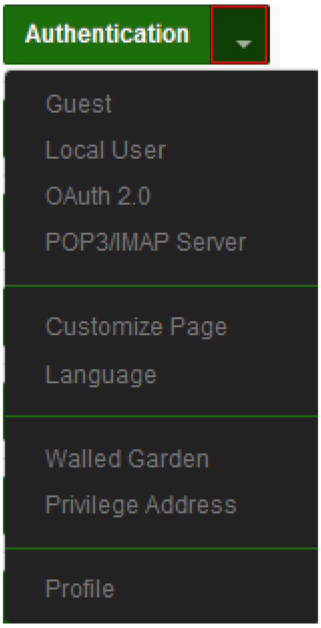
Secret Key Must

- **Authentication**：Administrator can enable or disable authentication function.
- **Multiple Login**：Administrator can set one account to multiple users simultaneously login and the users can set limit.(0 = not limited)
- **Login Timeout**：After account login for some time no traffic, system will automatic timeout for account. Administrator can enter a time(Minutes).
- **Redirect URL**：After the success of the login, system will redirect to URL. Administrator can enter web site URL.
- **Login URL**：Administrator can set URL for login page.
- **Session Log**：If network have Syslog server. Administrator can to system➔management setting IP address for syslog server and enable the function. Account session log will copy to syslog server.
- **Local User**：Administrator can enable authentication for local user. Create user account can to reference **"3.4 Local User"** setup**.**
- **RADIUS**：Authentication support remote RADIUS Server. Administrator can enter security information for remote RADIUS Server.

※ Authentication Dropdown Button

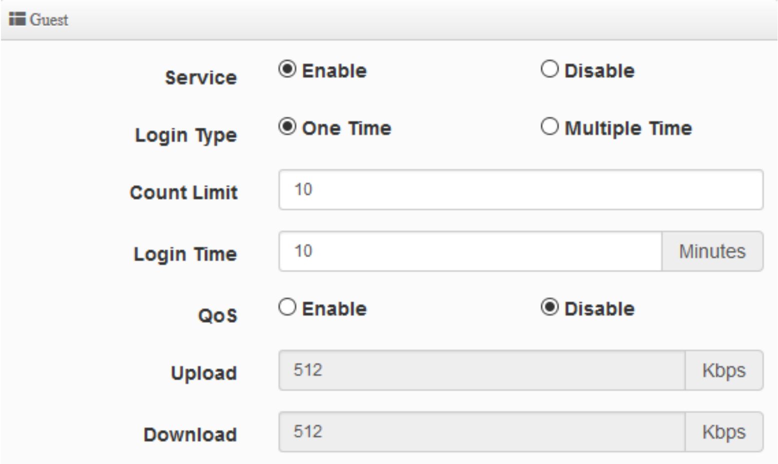
3.4.2 Set Authentication function

: By Clicking the Dropdown button, Administrators can set authentication functions.



# Guest

Administrator can enable or disable guest authentication. If enabled, the administrator can set guest Count Limit / login time and type and flow control.



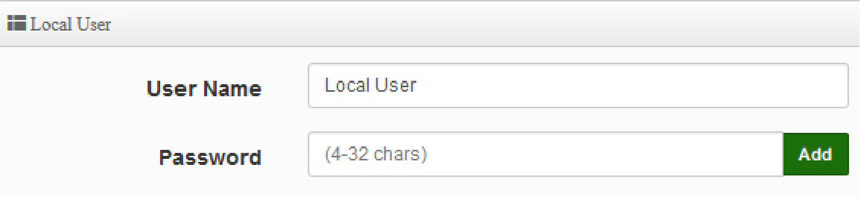
Guest

Service	● Enable	○ Disable
Login Type	● One Time	○ Multiple Time
Count Limit	10	
Login Time	10 Minutes	
QoS	○ Enable	● Disable
Upload	512 Kbps	
Download	512 Kbps	

- **Service**：Administrator can select enable or disable this function.
- **Login Type :**
  - **One Time:** Login to start counting until the end of time.
  - **Multiple Times:** logout time will stop counting until the next re-login to time start counting.
- **Count Limit:** Administrator can set guest limit.
- **Login Time:** Within a certain timeframe with no traffic, the system will auto logout.
- **QoS:** Administrator can restrict the traffic of guest. Traffic management can set users upload and download traffic.

# Local User

Administrator can create local user account for web login.



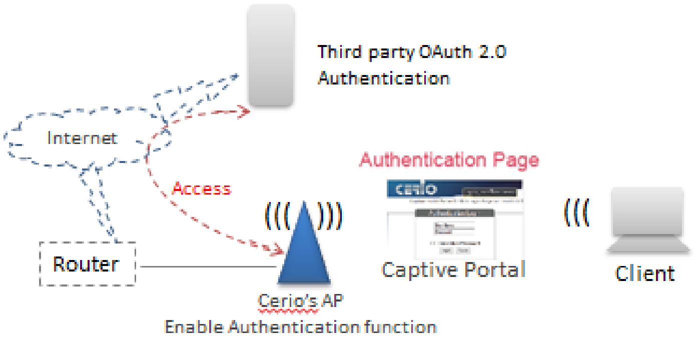
Local User

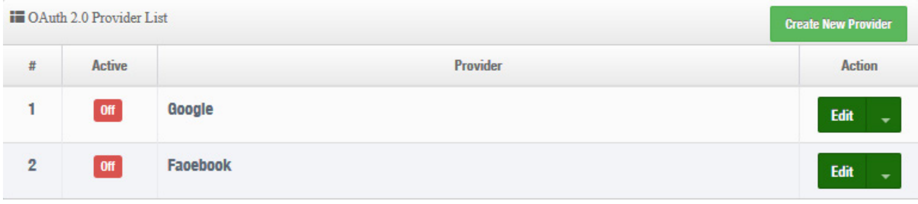
User Name	Local User
Password	(4-32 chars) Add

- ➢ **User Name：** Administrator can create users account.
- ➢ **Password：**Set account password.

# OAuth2.0

The OAuth2.0 function supports Facebook and Google by default. Users can add additional OAuth2.0 servers through UI settings.





OAuth 2.0 Provider List Create New Provider

#	Active	Provider	Action
1	Off	Google	Edit
2	Off	Facebook	Edit

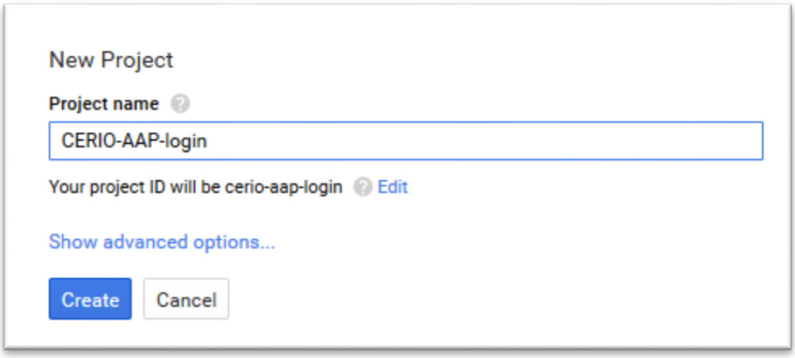
- ➢ **#：**Display items.
- ➢ **Active：**Display on/off status for the authentication.
- ➢ **Provider：**Display authentication server. The system default use authentication server for Google and Facebook

Sample for Google OAuth2.0 setup

Please complete the application on the Google website to receive an account ID and password, follow the steps below.

Step.1 Please go to the **Google Developers Console page** and **create a project**

(Reference https://developers.google.com/identity/protocols/OAuth2)



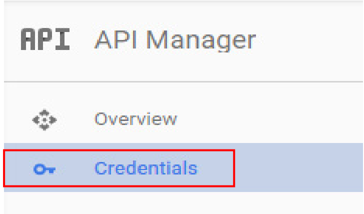
New Project

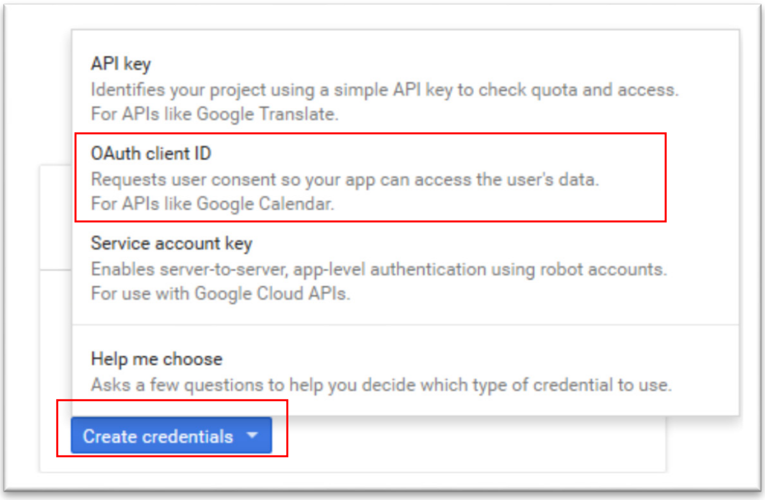
Project name

CERIO-AAP-login

Your project ID will be cerio-aap-login Edit

Step.2 Click Credentials to create OAuth client ID in the API manager page.





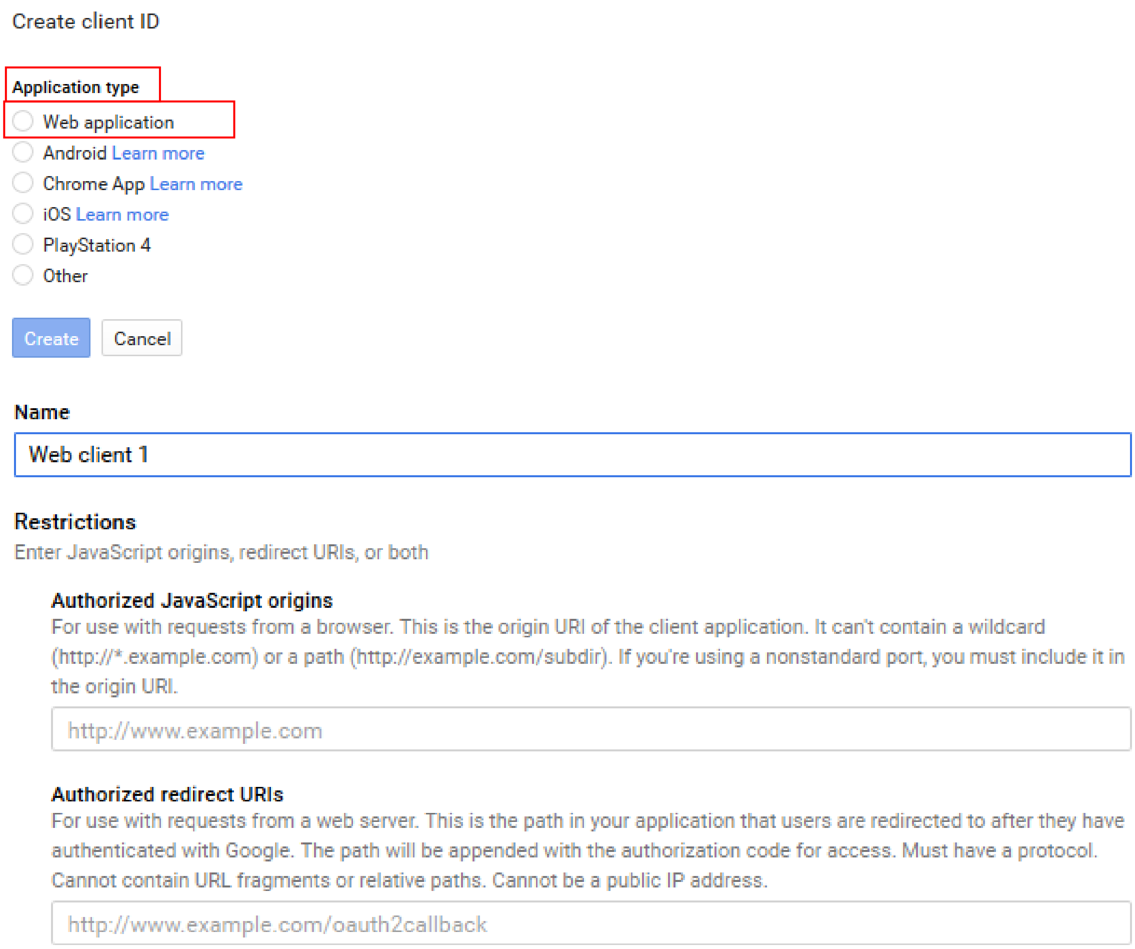
API key
Identifies your project using a simple API key to check quota and access.
For APIs like Google Translate.

OAuth client ID
Requests user consent so your app can access the user's data.
For APIs like Google Calendar.

Service account key
Enables server-to-server, app-level authentication using robot accounts.
For use with Google Cloud APIs.

Help me choose
Asks a few questions to help you decide which type of credential to use.

Step.3 Select web application in the "Application Type" section and set **"Restrictions"** URL.



Create client ID

Application type

○ Web application

○ Android Learn more

○ Chrome App Learn more

○ iOS Learn more

○ PlayStation 4

○ Other

Name

Web client 1

Restrictions

Enter JavaScript origins, redirect URIs, or both

Authorized JavaScript origins

For use with requests from a browser. This is the origin URI of the client application. It can't contain a wildcard (http://*.example.com) or a path (http://example.com/subdir). If you're using a nonstandard port, you must include it in the origin URI.

http://www.example.com

Authorized redirect URIs

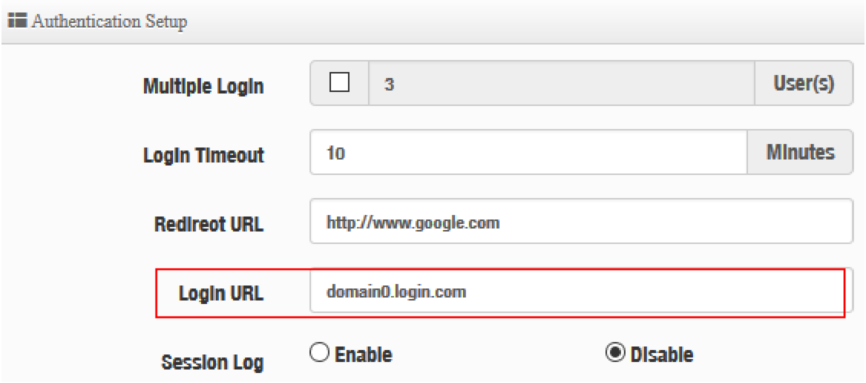
For use with requests from a web server. This is the path in your application that users are redirected to after they have authenticated with Google. The path will be appended with the authorization code for access. Must have a protocol. Cannot contain URL fragments or relative paths. Cannot be a public IP address.

http://www.example.com/oauth2callback

Step.4 Set Authorized JavaScript origins and Authorized redirect URLs (important)

Administrator must set login URL in the device function. After complete set of login URL go to the **"Restrictions"** function in web page. Follow the steps below to set login URLs

- Setup login URL in the device. Please Click **system➔Authentication** and enable the function.
- The "Authentication Setup" page to set Login URL

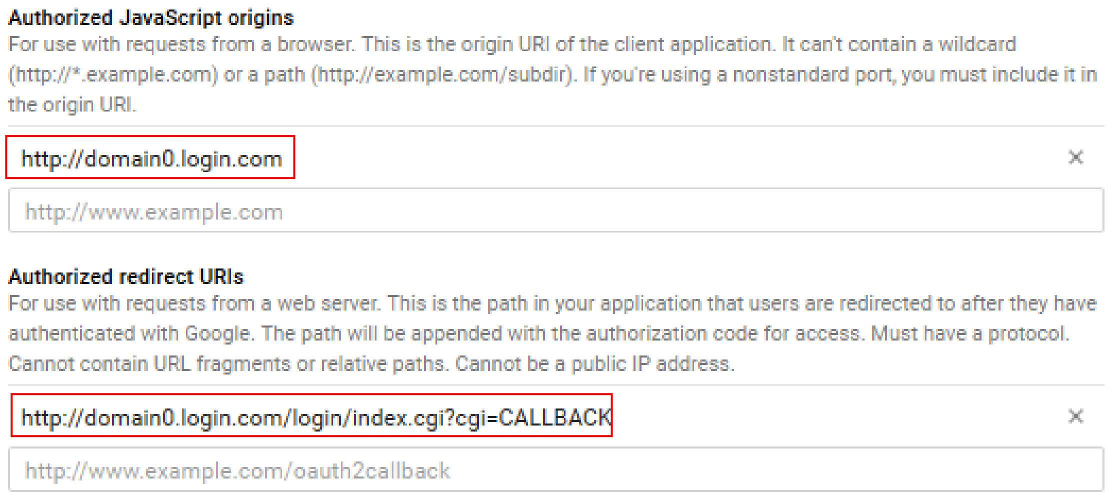


Authentication Setup

Multiple Login	□ 3	User(s)
Login Timeout	10	Minutes
Redirect URL	http://www.google.com	
Login URL	domain0.login.com	
Session Log	○ Enable	● Disable

After complete set of login URL go to the **"Restrictions"** function in web page. Copy and paste the login URL from the system display into the "Restriction" page on the Google Developer website.

- Google Authorized JavaScript origins URL is **http://domain0.login.com** (same as Login URL)
- Google Authorized redirect URLs is **http://domain0.login.com/login/index.cgi?cgi=CALLBACK**



Authorized JavaScript origins

For use with requests from a browser. This is the origin URI of the client application. It can't contain a wildcard (http://*.example.com) or a path (http://example.com/subdir). If you're using a nonstandard port, you must include it in the origin URI.

http://domain0.login.com ×

http://www.example.com

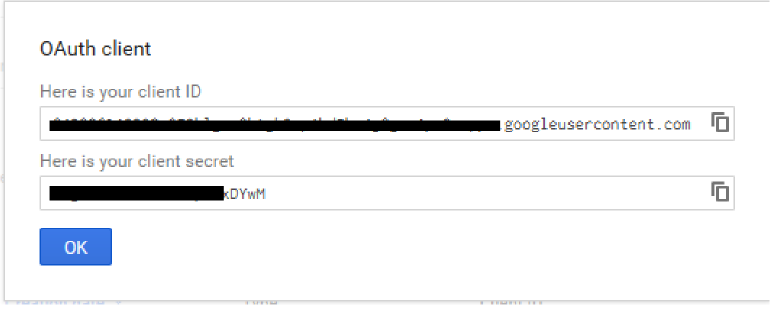
Authorized redirect URIs

For use with requests from a web server. This is the path in your application that users are redirected to after they have authenticated with Google. The path will be appended with the authorization code for access. Must have a protocol. Cannot contain URL fragments or relative paths. Cannot be a public IP address.

http://domain0.login.com/login/index.cgi?cgi=CALLBACK ×

http://www.example.com/oauth2callback

Step.5 After completing the "Restrictions" setup, click the create button. An OAuth Client page will pop-up with your "client ID" and "client secret". Administrators must copy and paste their client ID and secret into the OAuth 2.0 Setup page in our software UI.



OAuth client

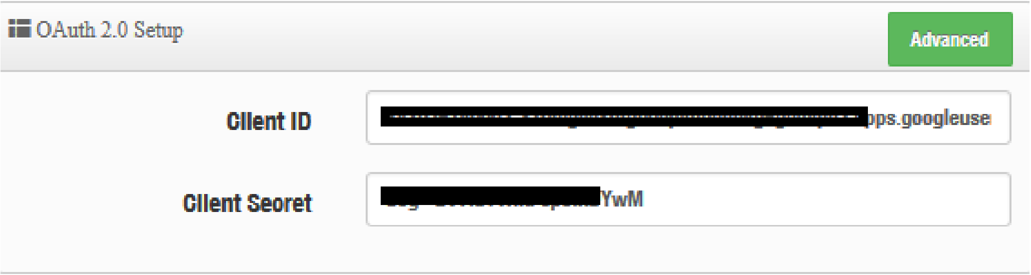
Here is your client ID

[redacted]googleusercontent.com

Here is your client secret

[redacted]kDYwM

OK



OAuth 2.0 Setup

Advanced

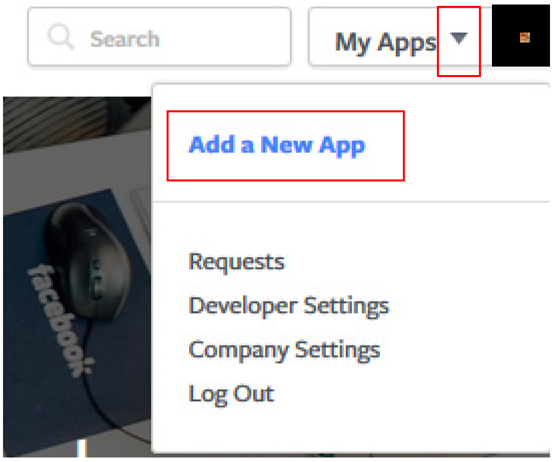
Client ID	[redacted]pps.googleuse
Client Secret	[redacted]YwM

Save and reboot the AP system, complete the setup.

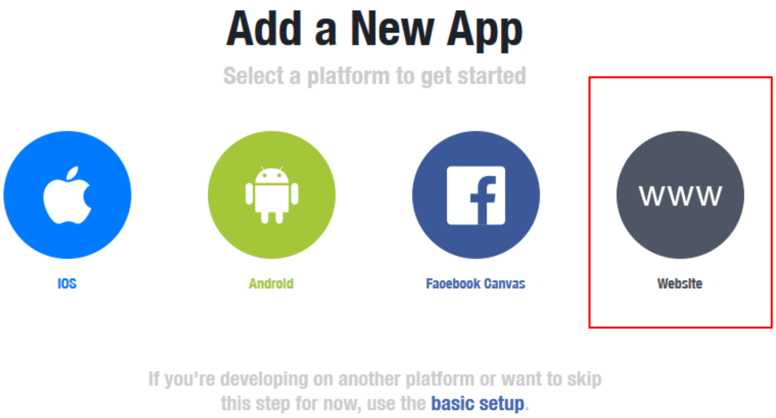
Sample for Facebook OAuth2.0 setup

Please complete the application on the Facebook website to receive an account ID and password, follow the steps below.

Step.1 Please to Facebook developer's page and add a New App

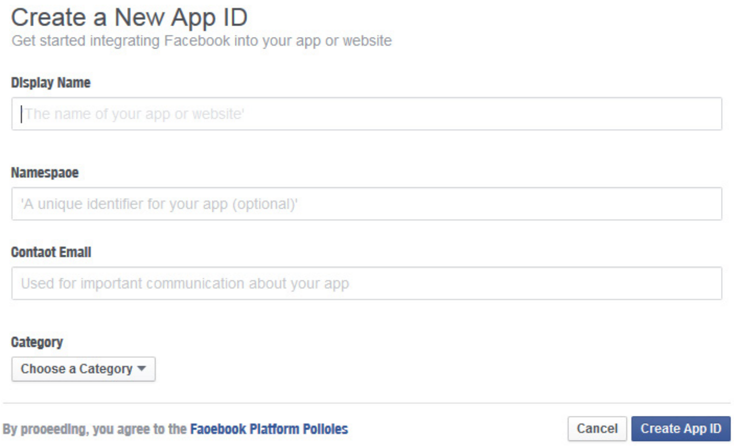


Step.2 Select WWW function



If you're developing on another platform or want to skip this step for now, use the basic setup.

Step.3 Administrator must set www for your information.



Create a New App ID

Get started integrating Facebook into your app or website

Dlsplay Name

'The name of your app or website'

Namespaoe

'A unique identifier for your app (optional)'

Contaot Emall

Used for important communication about your app

Category

Choose a Category ▾

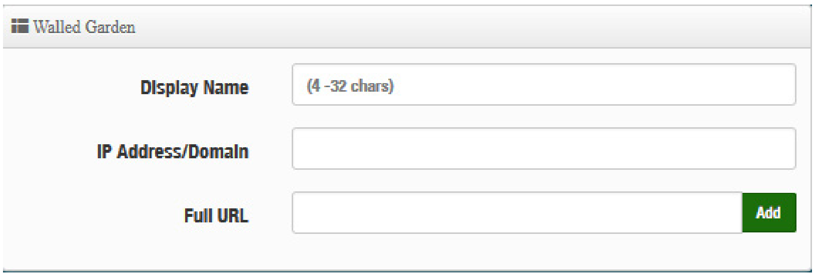
- Default Language: Display default language.

# Walled Garden

This function provides certain free services or advertisement web pages for users to access the websites listed before login and authentication. User without the network access right can still have a chance to experience the actual network service free of charge in Walled Garden URL list.



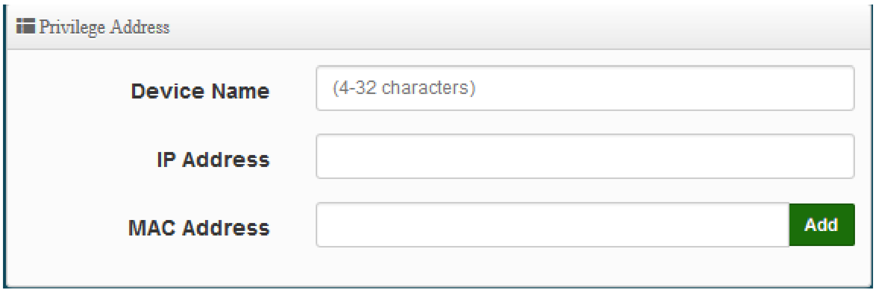
Walled Garden

Display Name	(4 -32 chars)
IP Address/Domain	
Full URL	

- ➢ **Display Name:** Set name of Website.
- ➢ **IP Address/Domain:** Set IP or Domain of the Open the website.
- ➢ **Full URL:** Set full website name.

# Privilege Address

This function provides local device can access Internet without authentication. If there are some workstations belonging NGS Access Point that need to access to network without authentication, enter the IP or MAC address of these workstations in this list.



Privilege Address

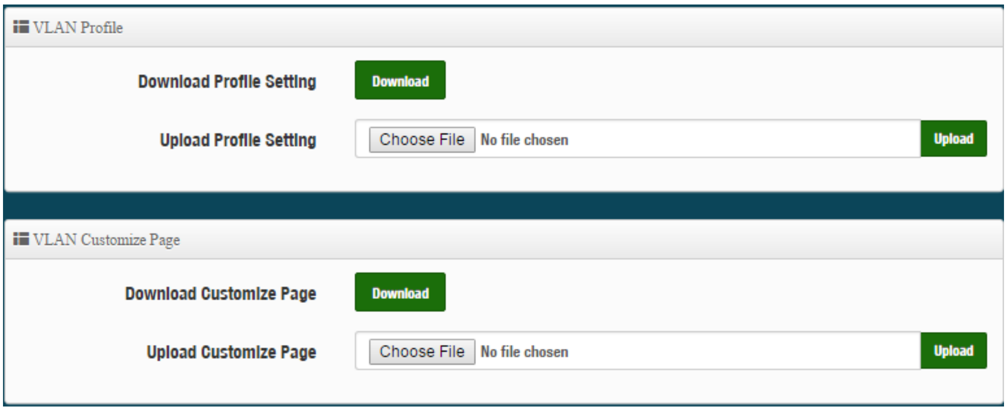
Device Name	(4-32 characters)
IP Address	
MAC Address	

- ➢ **Device Name:** Enter Device or Users Name.
- ➢ **IP Address:** Enter used IP Address of Device or Users PC.
- ➢ **MAC Address:** Enter MAC Address of Device or Users PC.

After the above function is setup, please click "**Save**" button and **reboot** system will apply new profile and working normally.

Profile

Administrator can backup current authentication configuration and login page for HTML Source code. But also can recover.



VLAN Profile

Download Profile Setting: Download

Upload Profile Setting: Choose File No file chosen Upload

VLAN Customize Page

Download Customize Page: Download

Upload Customize Page: Choose File No file chosen Upload

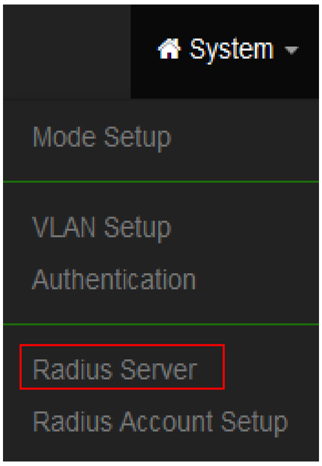
Click “**Save”** button to save your changes. Then click **Reboot** button to activate your changes.

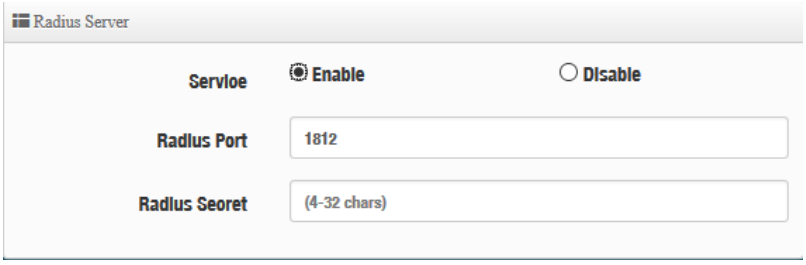
3.5 RADIUS Server

This function only used to operate in **Access Point** mode.

The function is 802.1x RADIUS Server. Administrator can enable or disable Server.

Please click on **System ➔ RADIUS Server**





Radius Server

Service: ● Enable ○ Disable

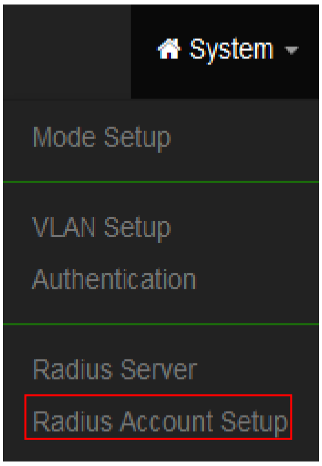
Radius Port: 1812

Radius Secret: (4-32 chars)

- **Service**：Administrator can select Enable or disable the function.
- **Radius**：Administrator must to set remote RADIUS Server use Port.
- **Radius Secret**：Administrator must to set remote RADIUS Server use Key.

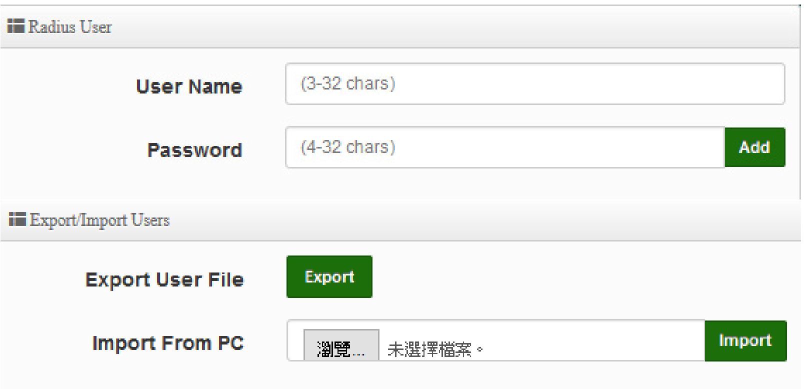
3.6 RADIUS Account Setup

When enabled RADIUS Server, administrator can add RADIUS account and password in the function. But also can recover or backup the RADIUS account



Notice This function only used in **Access Point** mode.

After enabled RADIUS server administrator can set RADIUS account in function. Max. 50 users account.



Radius User

User Name (3-32 chars)

Password (4-32 chars) Add

Export/Import Users

Export User File Export

Import From PC 瀏覽... 未選擇檔案。 Import

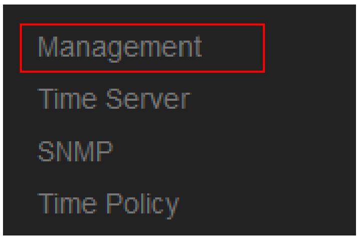
- ➢ **User Name**：Create users name for RADIUS account.
- ➢ **Password**：Enter password for user name.
- ➢ **Export User File**：Administrator can export account list in RADIUS Server.
- ➢ **Import From PC**：Administrator can import account list to the RADIUS Server.

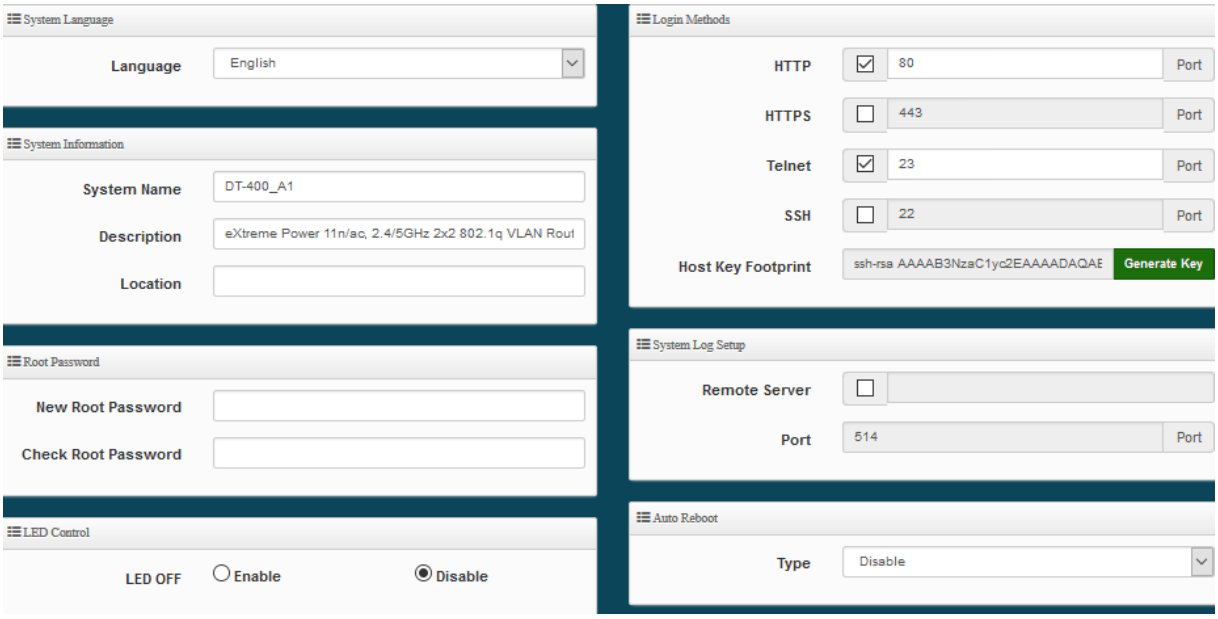
Click **"Save"** button to save your set function. Then click Reboot button to activate your changes.

3.7 Management

Administrators can specify geographical location of the system via instructions in this page and modify system login password and select use system login protocol by 80, 443, 23, 22 Port.

The management page adds LED control on/off and system auto reboot function.





System Language

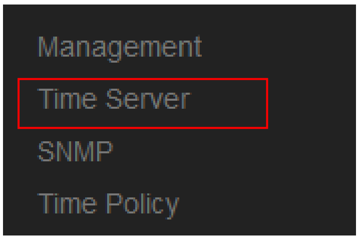
Click ***"Save"*** button to save your changes. And click ***"Reboot"*** button to activate your changes

3.8 Time Server

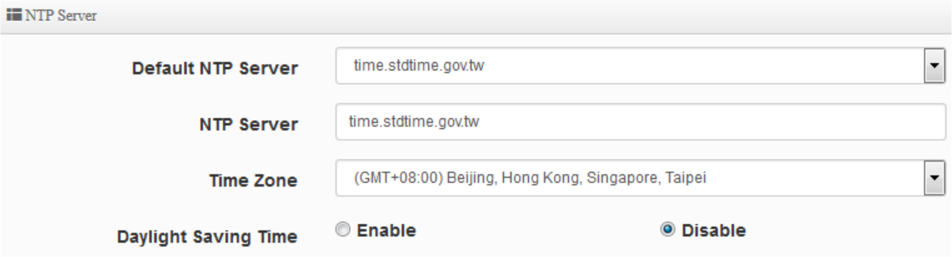
Administrator can select manual or via a NTP server to modify system time for the right local time.

If select update the system time for manual, when administrator reboot system the system time will reply default.

If select update the system time for the NTP Server, system must set gateway and DNS server, the system can be connected internet.

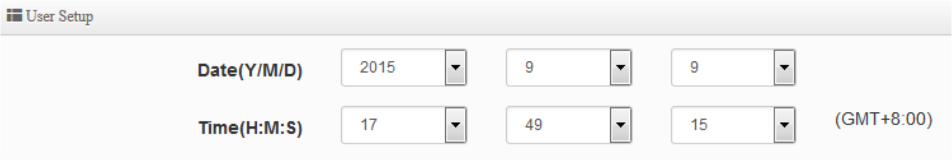


- **Mode:** Administrator can select NTP Server or Manual.
  - **NTP Server:** System can auto update the system time. Administrator needs setting as NTP Server.



Default NTP Server	time.stdtime.gov.tw
NTP Server	time.stdtime.gov.tw
Time Zone	(GMT+08:00) Beijing, Hong Kong, Singapore, Taipei
Daylight Saving Time	○ Enable ● Disable

  - ✓ **Default NTP Server:** Administrator can select NTP Server.
  - ✓ **NTP Server:** Administrator can setting as NTP Server.
  - ✓ **Time Zone:** Administrator can select a desired time zone from the drop-down list.
  - ✓ **Daylight saving Time:** Enable or disable Daylight saving.
  - **Manual:** Administrator must to set the system time.



Date(Y/M/D)	2015	9	9	
Time(H:M:S)	17	49	15	(GMT+8:00)

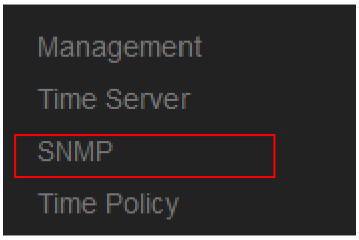
Notice	When used Manual to update time then after system reboot will reset to default time.

Click ***"Save"*** button to save your changes. And click ***"Reboot"*** button to activate your changes

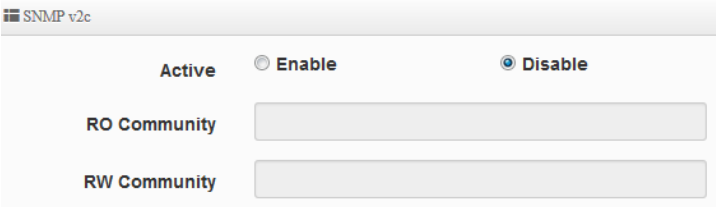
3.9 SNMP

SNMP is an application-layer protocol that provides a message format for communication between SNMP managers and agents. By enabling SNMP function, the administrator can obtain the system information remotely.

Please click on **System -> SNMP** and follow the below setting.



SNMP v2c function

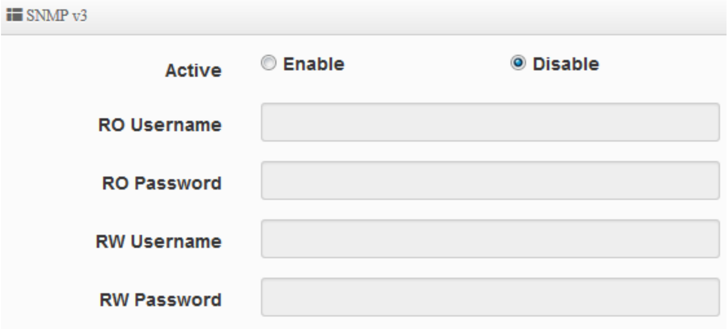


SNMP v2c

Active	○ Enable ● Disable
RO Community	
RW Community	

- ➢ **Active:** Administrator can select Enable or Disable the service.
- ➢ **RO Community:** Set a community string to authorize read-only access.
- ➢ **RW Community:** Set a community string to authorize read/write access.

SNMP v3 function



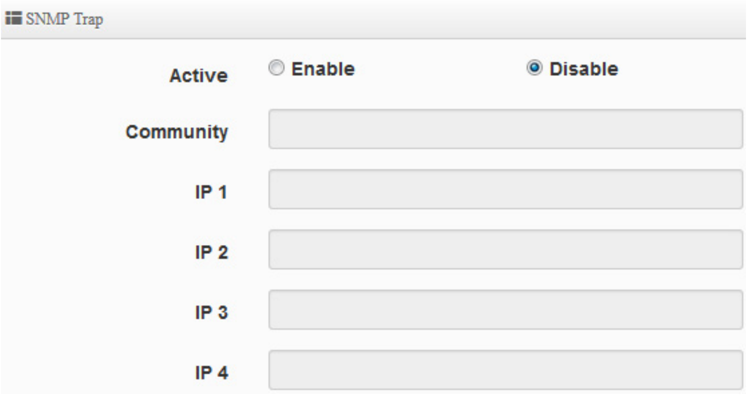
SNMP v3

Active	○ Enable ● Disable
RO Username	
RO Password	
RW Username	
RW Password	

- ➢ **Active:** Administrator can select Enable or Disable the service.
- ➢ **RO username:** Set a community string to authorize read-only access.
- ➢ **Ro password:** Set a password to authorize read-only access.
- ➢ **RW username:** Set a community string to authorize read/write access.
- ➢ **RW password:** Set a password to authorize read/write access.

SNMP Trap

Events such as cold start interface up & down, and association & disassociation will report to an assigned server.



SNMP Trap

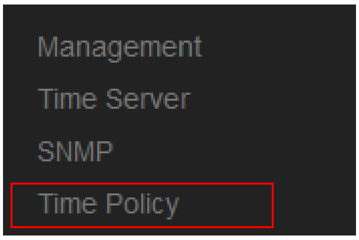
Active	○ Enable	● Disable
Community		
IP 1		
IP 2		
IP 3		
IP 4		

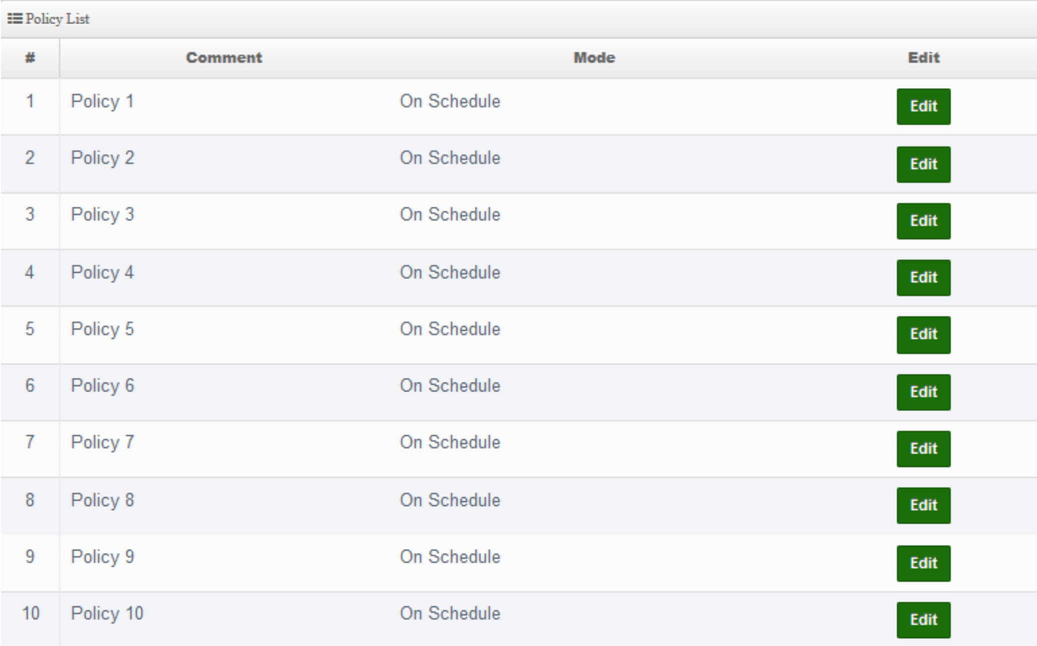
- **Active:** Administrator can select Enable or Disable the service.
- **Community:** Set a community string required by the remote host computer that will receive trap messages or notices send by the system.
- **IP(1~4) :** Enter the IP addresses of the remote hosts to receive trap messages.

Click ***"Save"*** button to save your changes. And click ***"Reboot"*** button to activate your changes

3.10 Time Policy

Please click System ➔ Time Policy to set time policy.

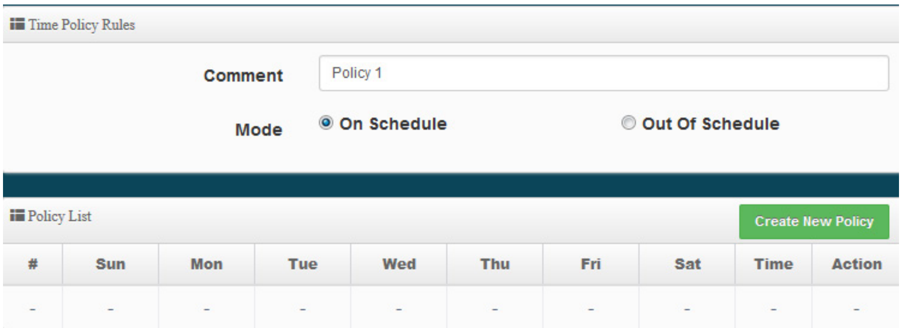




Policy List

#	Comment	Mode	Edit
1	Policy 1	On Schedule	Edit
2	Policy 2	On Schedule	Edit
3	Policy 3	On Schedule	Edit
4	Policy 4	On Schedule	Edit
5	Policy 5	On Schedule	Edit
6	Policy 6	On Schedule	Edit
7	Policy 7	On Schedule	Edit
8	Policy 8	On Schedule	Edit
9	Policy 9	On Schedule	Edit
10	Policy 10	On Schedule	Edit

Please click **Edit** button to setting Time Policy rules.



Time Policy Rules

Comment: Policy 1

Mode: ● On Schedule ○ Out Of Schedule

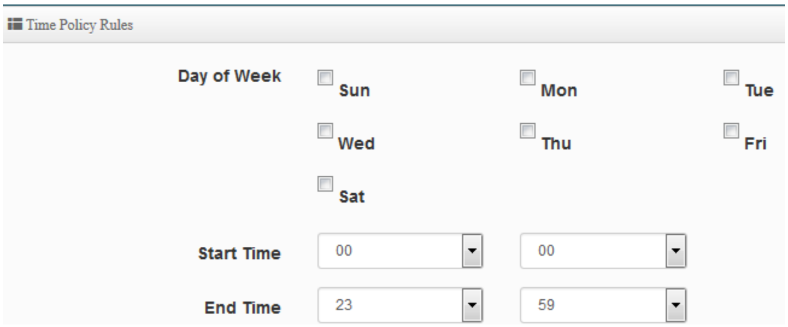
Policy List

#	Sun	Mon	Tue	Wed	Thu	Fri	Sat	Time	Action
-	-	-	-	-	-	-	-	-	-

- **Comment:** Enter the description of Time Policy rule.
- **Mode:** Administrator can select On schedule or Out of schedule to execution the rules.

Create New Policy button:

Administrator can set time for week / start time and end time.



Time Policy Rules

Day of Week: □ Sun □ Mon □ Tue □ Wed □ Thu □ Fri □ Sat

Start Time: 00 : 00

End Time: 23 : 59

Click "Save" button to add schedule to policy. There are 10 schedule maximum allowed in the each time policy. All schedules can be edited or removed in the each time policy. Click **Reboot** button to activate your changes.

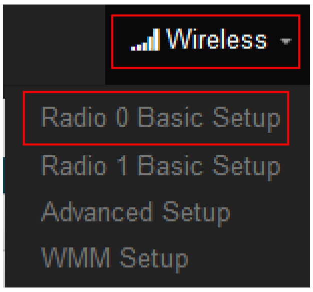
4. Wireless Configuration

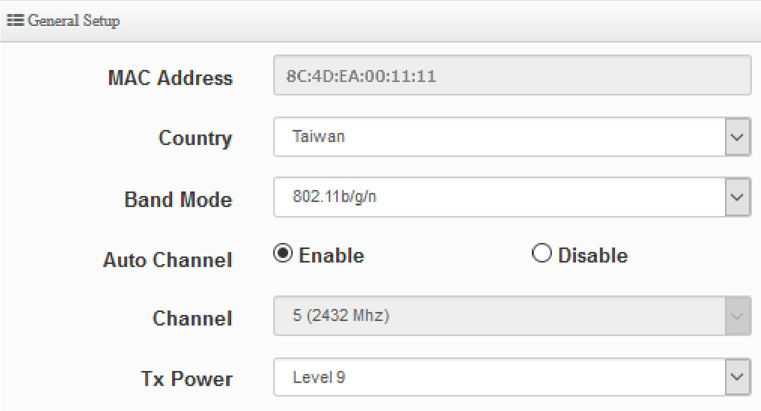
This menu will vary according to the different modes. Please confirm the required application mode (refer to 2.1 Operation Mode Setting and Introduction)

Notice

The following displays dual band device user interfaces. Single band 11n devices will only include Radio 0 settings in the software interface

4.1 Radio 0 Basic Setup (2.4G)

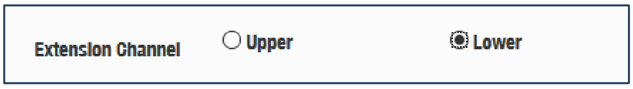




General Setup

MAC Address: 8C:4D:EA:00:11:11
Country: Taiwan
Band Mode: 802.11b/g/n
Auto Channel: ● Enable ○ Disable
Channel: 5 (2432 Mhz)
Tx Power: Level 9

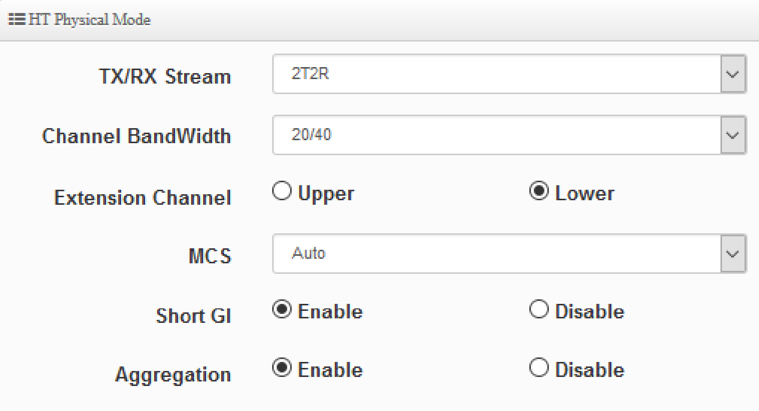
- **MAC Address:** Display 2.4G WiFi MAC address.
- **Country:** Administrator can select country: US or EU or Taiwan.
- **Band Mode:** Administrator can select 802.11b/g/n for the 2.4G Band.
- **Auto Channel:** Administrator can Enable or Disable the function. If disabled, the WiFi channel will be fixed to the manually selected channel.
- **Channel:** Administrator can select 1 to 11 CH. The Channel settings can be changed in **"HT Physical Mode" ➔" Extension Channel"** can select **Upper** or **Lower** channels.



Extension Channel ○ Upper ● Lower

- **Tx Power:** Administrator can control the WiFi Tx output power. The power Max. Level 9.

HT Physical Mode



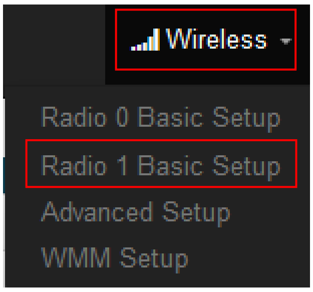
HT Physical Mode

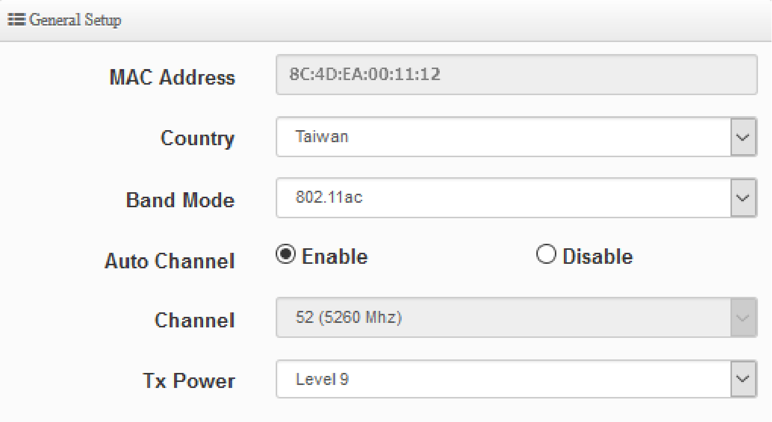
TX/RX Stream: 2T2R
Channel BandWidth: 20/40
Extension Channel: ○ Upper ● Lower
MCS: Auto
Short GI: ● Enable ○ Disable
Aggregation: ● Enable ○ Disable

- **TX/RX Stream:** The CenOS 5.0 AP utilizes 2 antenna and supports 2TX/2RX streams. Administrator can select 1 or 2 TX/RX. The default is 2TX/2RX.
- **Channel Bandwidth:** The "**20/40**" MHz option is usually best. The other option is available for special circumstances.
- **Extension Channel:** Sets channel select to Upper or Lower. The Upper supports 1 to 7 range CH and Lower supports 5 to 11 range CH.
- **MCS:** This parameter represents transmission rate. By default (Auto) the fastest possible transmission rate will be selected. You have the option of selecting the speed if necessary.
- **Shout GI:** Short Guard Interval is "Enabled" by default to increase throughput. However, it can also increase error rate in some installations, due to increased sensitivity to radio-frequency reflections. Select the option that works best for your installation.
- **Aggregation:** By default, it's "**Enabled**". Select "Disable" to deactivate Aggregation.
  A part of the 802.11n standard (or draft-standard), it allows sending multiple frames per single access to the medium by combining frames together into one larger frame. It creates the larger frame by combining smaller frames with the same physical source and destination end points and traffic class (i.e. QoS) into one large frame with a common MAC header.

4.2 Radio 1 Basic Setup (5G)

Notice	If Single band 11n devices will no Radio 1 function



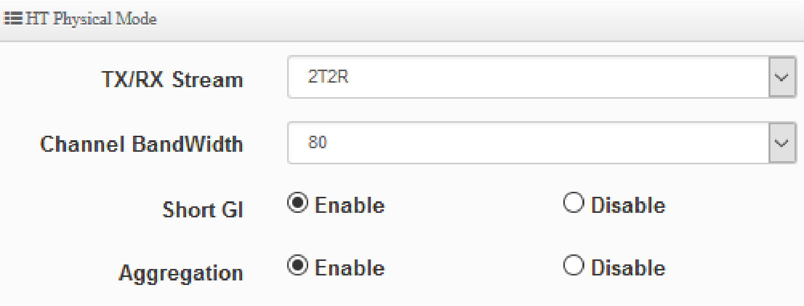


General Setup

MAC Address	8C:4D:EA:00:11:12
Country	Taiwan
Band Mode	802.11ac
Auto Channel	● Enable ○ Disable
Channel	52 (5260 Mhz)
Tx Power	Level 9

- **MAC Address:** Display 2.4G WiFi MAC address.
- **Country:** Administrator can select country: US or EU or Taiwan.
- **Band Mode:** Administrator can select 5G Band for 802.11a/n or 802.11ac. The default is 802.11ac
- **Auto Channel:** Administrator can Enable or Disable the function. If select disabled function the WiFi channel can be manually fixed.
- **Channel:** Supports US and EU country 5G Channel standards.
- **Tx Power:** Administrator can control the WiFi Tx output power. The power Max. Level 9.

HT Physical Mode



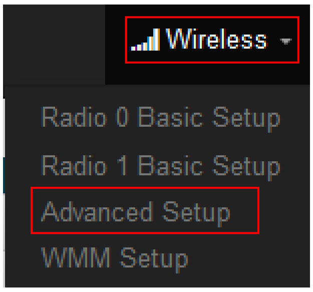
HT Physical Mode

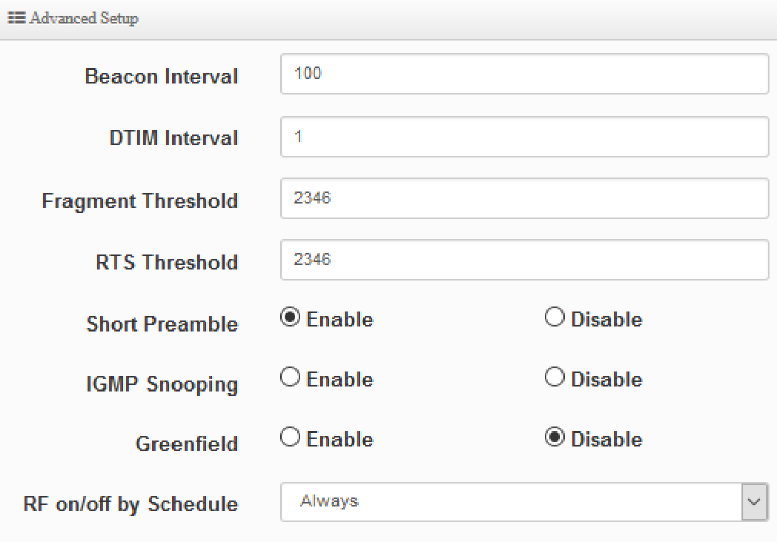
TX/RX Stream	2T2R	
Channel BandWidth	80	
Short GI	● Enable	○ Disable
Aggregation	● Enable	○ Disable

- **TX/RX Stream:** CenOS 5.0 APs utilizes 2 antennas and supports 2TX/2RX streams. Administrator can select 1 or 2 TX/RX. The default is 2TX/2RX.
- **Channel Bandwidth:** The "**20/40 and 802.11ac 80**" MHz option is usually the best. The other option is available for special circumstances.
- **Shout GI:** Short Guard Interval is "Enabled" by default to increase throughput. However, it can also increase error rate in some installations, due to increased sensitivity to radio-frequency reflections. Select the option that works best for your installation.
- **Aggregation:** By default, it's "**Enable**". Select "Disable" to deactivate Aggregation.
  A part of the 802.11n standard (or draft-standard). It allows sending multiple frames per single access to the medium by combining frames together into one larger frame. It creates the larger frame by combining smaller frames with the same physical source and destination end points and traffic class (i.e. QoS) into one large frame with a common MAC header.

Click **"Save"** button to save your set function. Then click "Reboot" button to activate your changes.

4.3 Advanced Setup





Advanced Setup

Beacon Interval	100	
DTIM Interval	1	
Fragment Threshold	2346	
RTS Threshold	2346	
Short Preamble	● Enable	○ Disable
IGMP Snooping	○ Enable	○ Disable
Greenfield	○ Enable	● Disable
RF on/off by Schedule	Always	

- **Beacon Interval:** Beacon Interval is in the range of **40~3500** and set in unit of *millisecond*. The default value is **100** msec.

  Access Point (AP) in IEEE 802.11 will send out a special approximated 50-byte frame, called "Beacon". Beacon is broadcast to all the stations, provides the basic information of AP such as SSID, channel, encryption keys, signal strength, time stamp, support data rate.

  All the radio stations received beacon recognizes the existence of such AP, and may proceed next actions if the information from AP matches the requirement. Beacon is sent on a periodic basis, the time interval can be adjusted.

  By increasing the beacon interval, you can reduce the number of beacons and associated overhead, but that will likely delay the association and roaming process because stations scanning for available access points may miss the beacons. You can decrease the beacon interval, which increases the rate of beacons. This will make the association and roaming process very responsive; however, the network will incur additional overhead and throughput will go down.

- **DTIM Interval:** The DTIM interval is in the range of **1~255**. The default is **1**.

  DTIM is defined as *Delivery Traffic Indication Message*. It is used to notify the wireless stations, which support power saving mode, when to wake up to receive multicast frame. DTIM is necessary and critical in wireless environment as a mechanism to fulfill power-saving synchronization.

  A DTIM interval is a count of the number of beacon frames that must occur before the access point sends the buffered multicast frames. For instance, if DTIM Interval is set to 3, then the Wi-Fi clients will expect to receive a multicast frame after receiving three Beacon frame. The higher DTIM interval will help power saving and possibly decrease wireless throughput in multicast applications.

- **Fragmentation Threshold:** Fragmentation Threshold is one more parameter which is given in all stations and Access points. Fine tuning Fragmentation Threshold parameter can result in good throughput but not using it properly can results in low throughput. In simple words it does the same thing which MTU do in Ethernet. Both are different parameters but the work done is same, it fragments the data packets.

  Fragmentation threshold will be used when we have more data packet size to be transmitted and we have less fragment threshold value. Let's say from Ethernet we have to send 1400 byte packet but the fragmentation threshold is set as 400. In this case when the packet is to be transmitted on air it will fragment the packet in to 4 small packet 400+400+400+200 and send on air. This includes MAC header+ frame body and CRC so 400 byte will be in total including headers. This helps in increasing the throughput. The default is 2346.

- **RTS Threshold:** TRTS Threshold is in the range of **1~2347** byte. The default is **2347** byte.

The main purpose of enabling RTS by changing RTS threshold is to reduce possible collisions due to hidden wireless clients. RTS in AP will be enabled automatically if the packet size is larger than the Threshold value. By default, RTS is disabled in a normal environment supports non-jumbo frames.

- **Short Preamble:** By default, this function is "***Enabled***". ***Disabling*** will automatically use the Long 128-bit Preamble Synchronization field. The preamble is used to signal "here is a train of data coming" to the receiver. The short preamble provides 72-bit Synchronization field to improve WLAN transmission efficiency with less overhead.
- **IGMP Snooping:** The process of listening to Internet Group Management Protocol (IGMP) network traffic. The feature allows a network switch to listen in on the IGMP conversation between hosts and routers. By listening to these conversations the switch maintains a map of which links need which IP multicast streams. Multicasts may be filtered from the links which do not need them and thus controls which ports receive specific multicast traffic.
- **Greenfield:** In wireless WLAN technology, greenfield mode is a feature of major components of the 802.11n specification. The greenfield mode feature is designed to improve efficiency by eliminating support for 802.11b/g devices in an all draft-n network. In greenfield mode the network can be set to ignore all earlier standards.
- **RF on/off by schedule:** Administrator can apply Time Policy to on or off wireless signal.

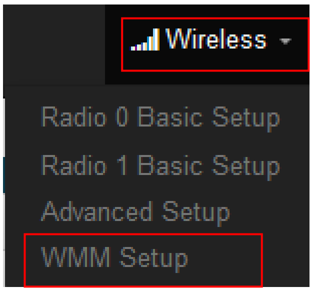
4.4 WMM Setup

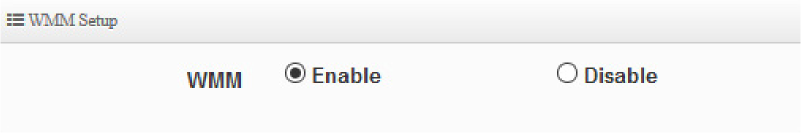
This affects traffic flowing from the access point to the client station.

Configuring QoS options consists of setting parameters on existing queues for different types of wireless traffic. You can configure different minimum and maximum wait times for the transmission of packets in each queue based on the requirements of the media being sent. Queues automatically provide minimum transmission delay for Voice, Video, multimedia, and mission critical applications, and rely on best-effort parameters for traditional IP data.

As an Example, time-sensitive Voice & Video, and multimedia are given effectively higher priority for transmission (lower wait times for channel access), while other applications and traditional IP data which are less time-sensitive but often more data-intensive are expected to tolerate longer wait times.

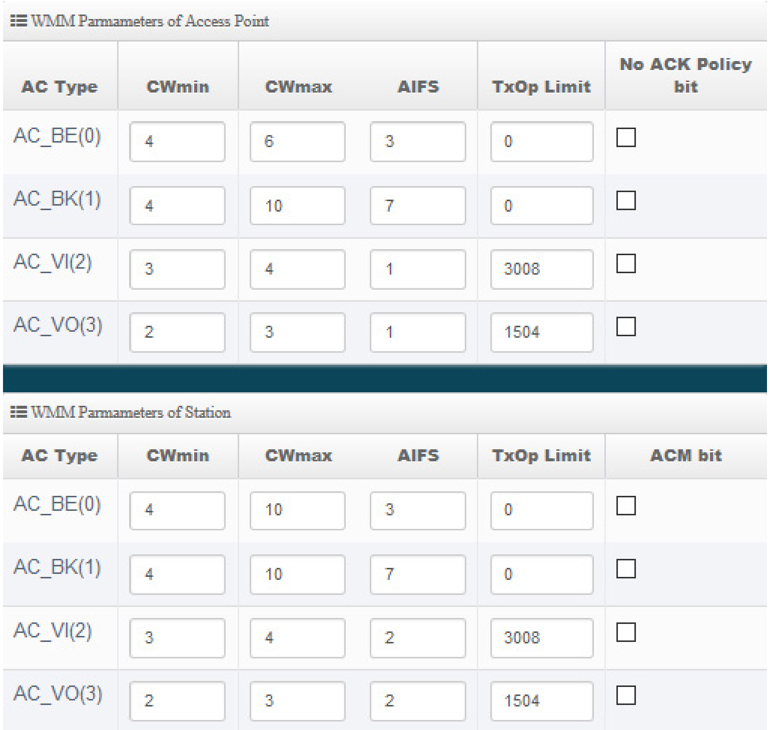
Please click on **Wireless -> WMM Setup**





WMM Setup

WMM ● Enable ○ Disable



☰ WMM Parmameters of Access Point

AC Type	CWmin	CWmax	AIFS	TxOp Limit	No ACK Policy bit
AC_BE(0)	4	6	3	0	□
AC_BK(1)	4	10	7	0	□
AC_VI(2)	3	4	1	3008	□
AC_VO(3)	2	3	1	1504	□

☰ WMM Parmameters of Station

AC Type	CWmin	CWmax	AIFS	TxOp Limit	ACM bit
AC_BE(0)	4	10	3	0	□
AC_BK(1)	4	10	7	0	□
AC_VI(2)	3	4	2	3008	□
AC_VO(3)	2	3	2	1504	□

- **AC Type** ：

Queue	Data Transmitted AP to Clients	Priority	Description
AC_BK	Background	Low	High throughput. Bulk data that requires maximum throughput and is not time-sensitive is sent to this queue (FTP data, for example).
AC_BE	Best Effort	Medium	Medium throughput and delay. Most traditional IP data is sent to this queue.
AC_VI	Video	High	Minimum delay. Time-sensitive video data is automatically sent to this queue.
AC_VO	Voice	High	Time-sensitive data like VoIP and streaming media are automatically sent to this queue.

- **CWmin**: Minimum Contention Window. This parameter is input to the algorithm that determines the initial random backoff wait time ("window") for retry of a transmission. The value specified here in the Minimum Contention Window is the upper limit (in milliseconds) of a range from which the initial random backoff wait time is determined.
- **CWmax**: Maximum Contention Window. The value specified here in the Maximum Contention Window is the upper limit (in milliseconds) for the doubling of the random backoff value. This doubling continues until either the data frame is sent or the Maximum Contention Window size is reached. Once the Maximum Contention Window size is reached, retries will continue until a maximum number of retries allowed is reached. Valid values for the "cwmax" are 1, 3, 7, 15, 31, 63, 127, 255, 511, or 1024. The value for "cwmax" must be higher than the value for "cwmin". 。

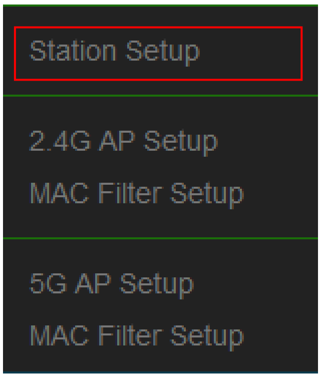
- **AIFS**：The Arbitration Inter-Frame Spacing Number specifies a wait time (in milliseconds) for data frames。
- **TxOP Limit**: Transmission Opportunity is an interval of time when a WME AP has the right to initiate transmissions onto the wireless medium (WM). This value specifies (in milliseconds) the Transmission Opportunity (TXOP) for AP; that is, the interval of time when the WMM AP has the right to initiate transmissions on the wireless network.。
- **ACM bit**: Admission Control Mandatory, ACM only takes effect on AC_VI and AC_VO. When you do not click Checkbox, it means that the ACM is controlled by the connecting AP. If you click Checkbox, it means that the Client is in charge。
- **No ACK policy bit**: Acknowledgment Policy, WMM defines two ACK policies: **Normal ACK** and **No ACK**. Click “**Checkbox**” indicates “**No ACK**”

  When the no acknowledgement (No ACK) policy is used, the recipient does not acknowledge received packets during wireless packet exchange. This policy is suitable in the environment where communication quality is fine and interference is weak.

  While the No ACK policy helps improve transmission efficiency, it can cause increased packet loss when communication quality deteriorates. This is because when this policy is used, a sender does not retransmit packets that have not been received by the recipient.

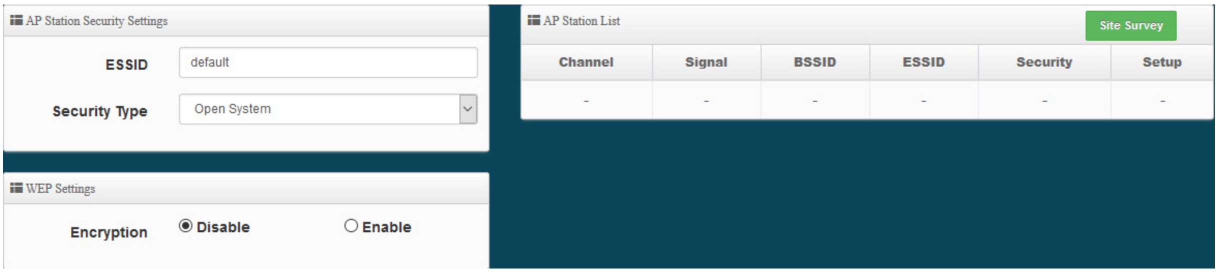
  When the Normal ACK policy is used, the recipient acknowledges each received uncast packet.

4.5 Station Setup



Notice	This feature only used operate in Client Bridge / WISP mode

The functions setting include Client Bridge link to AP station. Administrator can used “site survey” function to Search for AP stations.



AP Station Security Settings

ESSID	default
Security Type	Open System

WEP Settings

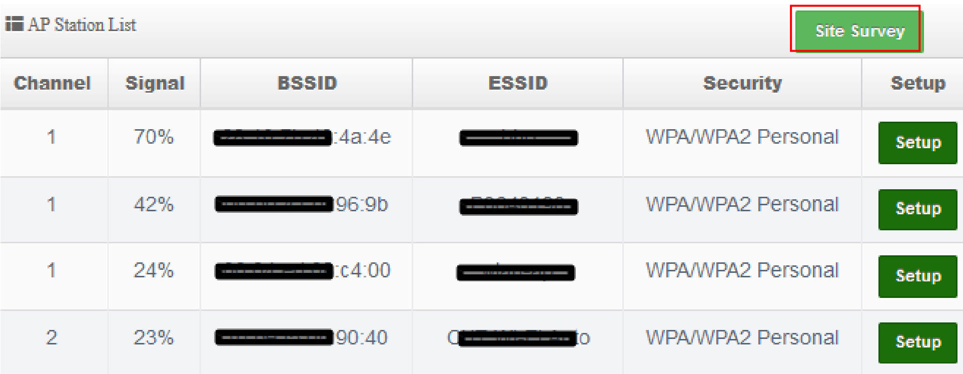
Encryption ● Disable ○ Enable

AP Station List

Channel	Signal	BSSID	ESSID	Security	Setup
-	-	-	-	-	-

Wireless Bridge Steps

1. Click "Site Survey" button to let the system look for the nearby station.

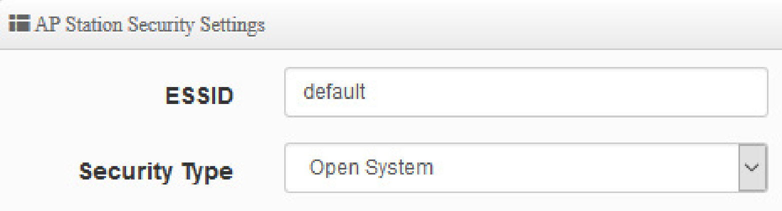


AP Station List

Channel	Signal	BSSID	ESSID	Security	Setup
1	70%	[redacted]:4a:4e	[redacted]	WPA/WPA2 Personal	Setup
1	42%	[redacted]96:9b	[redacted]	WPA/WPA2 Personal	Setup
1	24%	[redacted]:c4:00	[redacted]	WPA/WPA2 Personal	Setup
2	23%	[redacted]90:40	[redacted]	WPA/WPA2 Personal	Setup

When the system finds the site will be displayed on the list.

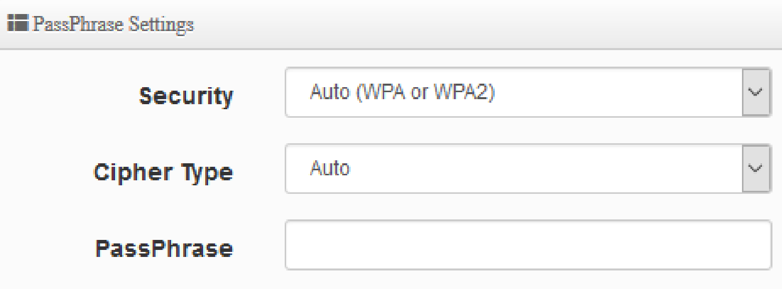
2. Administrators can click the Setup button from in the list
3. After click Setup button, the station information will display to AP Station Security Settings.



AP Station Security Settings

ESSID	default
Security Type	Open System

4. If the station(SSID) has use encryption, administrator need manual to setup security information for SSID.



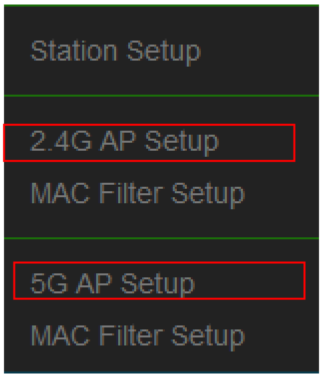
PassPhrase Settings

Security	Auto (WPA or WPA2)
Cipher Type	Auto
PassPhrase	

Click **"Save"** button to save your set function. Then click "Reboot" button to activate your changes.

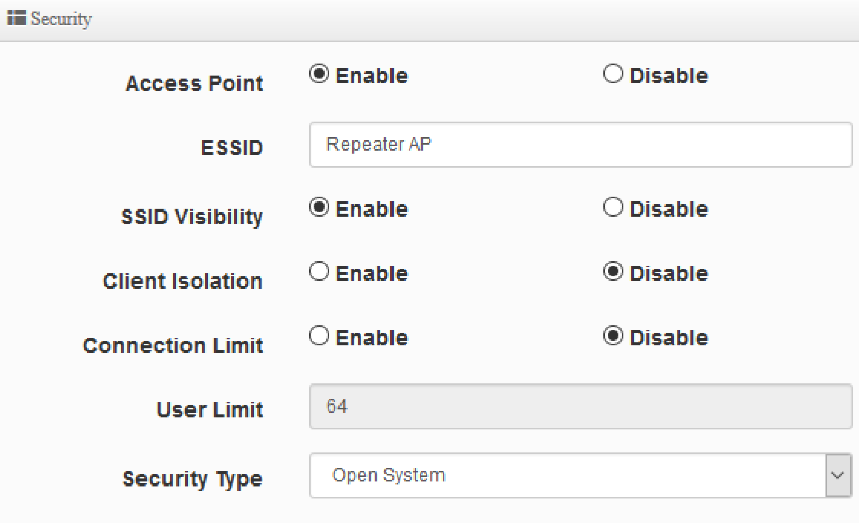
4.6 2.4G / 5G AP Setup (Repeater)

This function is only used **Client Bridge** and **WISP** mode. After wireless bridge, device can create a new wireless station again. (Repeater AP) Refer to 2.1 operation Mode of Client Bridge and WISP mode setting and introduction.



After wireless bridge success, administrator can choose to enable or disable radio 2.4G and 5G signal extension function (Repeater AP).
If administrator choose enable 2.4G or 5G (Repeater AP), the device will become repeater AP station provided to the Wi-Fi user connection.

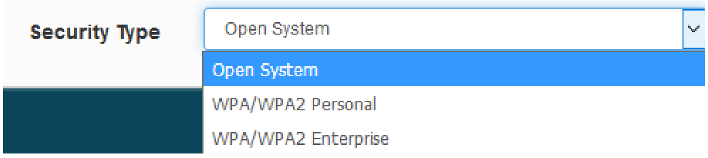
Notice: Repeater function and bridge is father and son relationship, when Bridge failed then repeater AP will unable to display.



Security

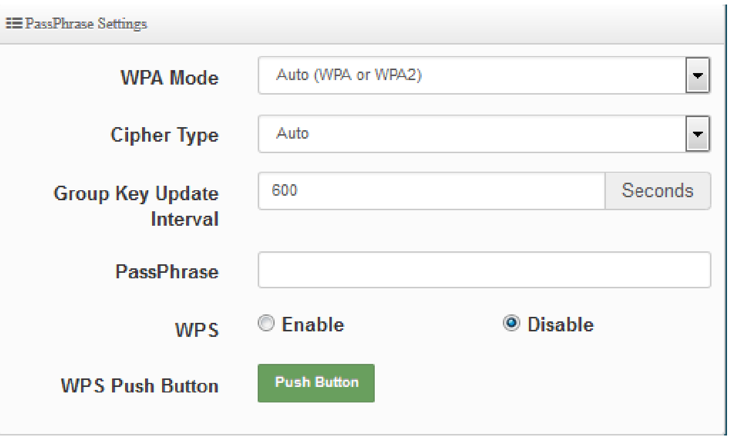
Access Point	● Enable	○ Disable
ESSID	Repeater AP	
SSID Visibility	● Enable	○ Disable
Client Isolation	○ Enable	● Disable
Connection Limit	○ Enable	● Disable
User Limit	64	
Security Type	Open System	

- **Access Point**：Administrator can choose Enable or Disable 2.4G/5G repeater function.
- **ESSID:** Set ESSID name of the Repeater AP.
- **SSID Visibility:** The default it’s Enable**.** When select Disable the SSID will not is discovered.
- **Client Isolation:** This function is Disabled by default. All clients will be isolated from each other, which mean they can’t reach each other.
- **Connection Limit:** This function is Disabled by default. If select Enable, Administrator can limit Wi-Fi users the Quantity.
- **Authentication:** Select the desired security type from the drop-down list; the options are WPA/WPA2-PSK and WPA/WPA2-Enterprise.



Security Type: Open System

- **Open System:** Data are not unencrypted during transmission when this option is selected.
- **WPA/WPA2 Personal:** WPA/WPA2 is short for W-Fi Protected Access-Pre-Shared Key. WPA/WPA2 uses the same encryption way with WPA, and the only difference between them is that WPA/WPA2 recreates a simple shared key, instead of using the user's certification.



PassPhrase Settings

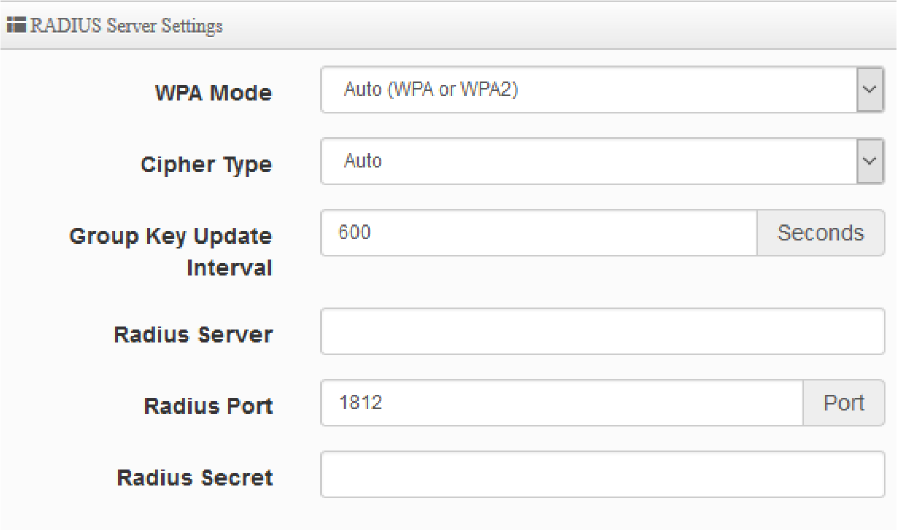
WPA Mode	Auto (WPA or WPA2)
Cipher Type	Auto
Group Key Update Interval	600 Seconds
PassPhrase	
WPS	○ Enable ● Disable
WPS Push Button	Push Button

- ✓ **WPA Mode:** Administrator can select security for Auto or only WPA or only WPA2.
- ✓ **Cipher Type:** Administrator can select use AES or TKIP with WPA / WPA2 encryption method.

  AES is short for "**Advanced Encryption Standard**", The AES cipher is specified as a number of repetitions of transformation rounds that convert the input plaintext into the final output of ciphertext. Each round consists of several processing steps, including one that depends on the encryption key. A set of reverse rounds are applied to transform ciphertext back into the original plaintext using the same encryption key.

  TKIP is short for "**Temporal Key Integrity Protocol**", TKIP scrambles the keys using a hashing algorithm and, by adding an integrity-checking feature, ensures that the keys haven't been tampered with.
- ✓ **Group Key Update Interval**: This time interval for re-keying GTK (broadcast/multicast encryption keys) in seconds. Enter the time-length required; the default time is 600 seconds.
- ✓ **Pass Phrase:** Enter the ESSID pass phrase.
- ✓ **WPS:** Administrator can used WPS function link WiFi client, if select enable the function, administrator can click the WPS Push Button.

- **WPA/WPA2-Enterprise:** When WPA/WPA2-Enterprise authentication is enabled, please refer to the following Dynamic WEP and RADIUS settings to complete the configuration.



RADIUS Server Settings

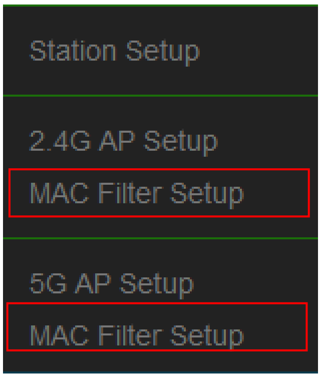
WPA Mode	Auto (WPA or WPA2)
Cipher Type	Auto
Group Key Update Interval	600 Seconds
Radius Server	
Radius Port	1812 Port
Radius Secret	

- ✓ **WPA Mode:** Administrator can select security for Auto or only WPA or only WPA2.
- ✓ **Cipher Type:** Administrator can select use AES or TKIP with WPA / WPA2 encryption method.

  AES is short for "**Advanced Encryption Standard**", The AES cipher is specified as a number of repetitions of transformation rounds that convert the input plaintext into the final output of ciphertext. Each round consists of several processing steps, including one that depends on the encryption key. A set of reverse rounds are applied to transform ciphertext back into the original plaintext using the same encryption key.

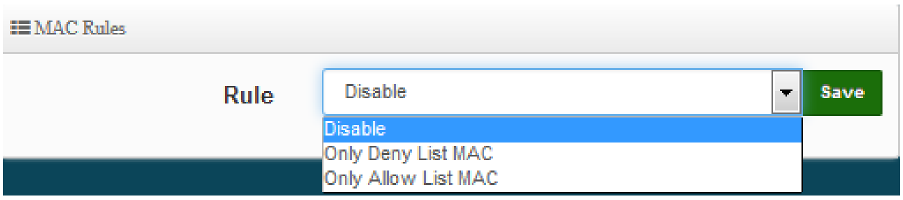
  TKIP is short for "**Temporal Key Integrity Protocol**", TKIP scrambles the keys using a hashing algorithm and, by adding an integrity-checking feature, ensures that the keys haven't been tampered with.
- ✓ **Group Key Update Interval**: This time interval for re-keying GTK (broadcast/multicast encryption keys) in seconds. Enter the time-length required; the default time is 600 seconds.
- ✓ **Radius Server:** Enter the IP address of the Authentication RADIUS server.
- ✓ **Radius Port:** The port number used by Authentication RADIUS server. Use the default 1812 or enter port number specified.
- ✓ **Radius Secret:** The secret key for system to communicate with Authentication RADIUS server. Support 1 to 64 characters.

4.7 MAC Filter Setup



The administrator can allow or reject Wi-Fi clients to access AP.

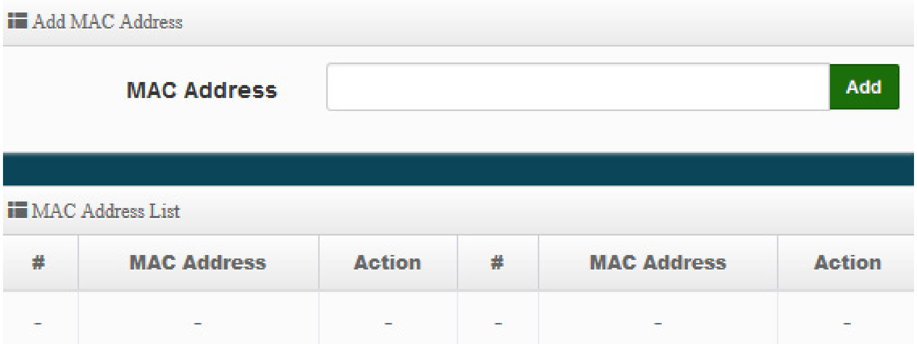
Notice	This feature only used operate in Client Bridge / WISP mode



Rule: Disable

- Disable
- Only Deny List MAC
- Only Allow List MAC

- **Only Deny List MAC**: Define certain wireless clients in the list which will have denied access to the Access Point while the access will be granted for all the remaining clients - Action Type is set to "**Only Deny List MAC**".
- **Only Allow List MAC**: Define certain wireless clients in the list which will have granted access to the Access Point while the access will be denied for all the remaining clients – Action Type is set to "**Only Allow List MAC**".

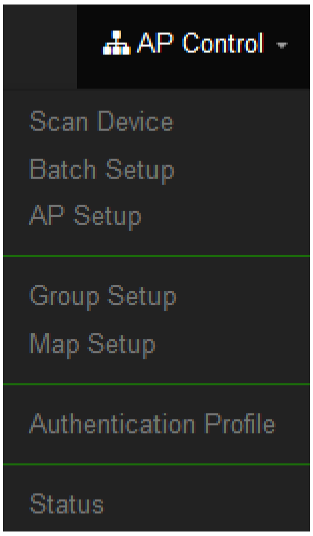


MAC Address:

#	MAC Address	Action	#	MAC Address	Action
-	-	-	-	-	-

- **MAC Address:** Enter MAC Address for WiFi Clients.
- **MAC Address List:** Display the MAC address of WiFi Clients.

5. AP Control



Notice | This function only used operate in CAP mode

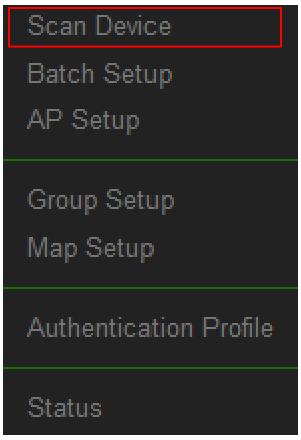
The CAP mode itself isn't Access Point. This mode is primarily to control all the managed AP.

Administrator can centralized setting CERIO's managed AP inclusion IP address / Wireless / system management / firmware upgrade / Web authentication function and MAP setting.

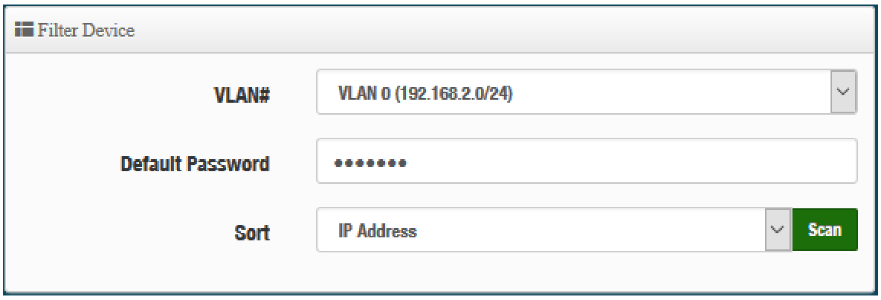
# Centralized Management APs operating Instructions:

1) Click **"Scan Device"** to discover Access Points in the network architecture.
2) Set IP address for all managed Access Points and reboot managed Access Points.
3) Re-Scan managed APs and Import to databases.
4) Centralize managed AP settings by clicking "**AP control**" ➔ **"Batch setup"**
5) After the setup is complete for managed APs function, administrator must reboot all managed APs.

5.1 Scan Device



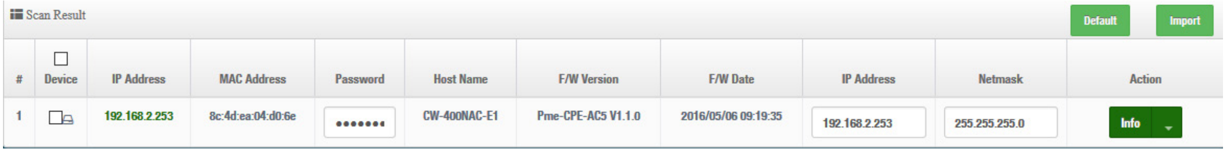
This management page can discover all managed APs in the network. Administrator can set IP address / Password and VLAN tag for managed APs. After the setup is complete, Administrator must import all managed APs to databases.



Filter Device

VLAN#	VLAN 0 (192.168.2.0/24)
Default Password	•••••••
Sort	IP Address

- **VLAN# :** Administrator can select VLAN network to discovery managed Aps
- **Default Password:** Set login system password by managed Aps.
- **Sort**: Administrator can select discovery managed Aps Type. (IP or MAC)



#	□ Device	IP Address	MAC Address	Password	Host Name	F/W Version	F/W Date	IP Address	Netmask	Action

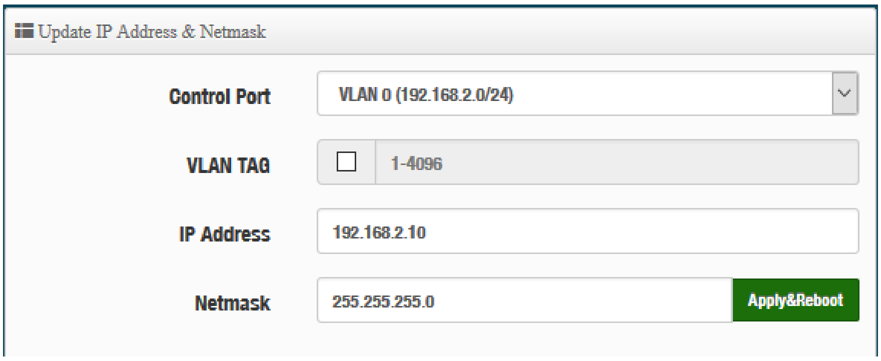
- **#：** Display managed APs items.
- **Device：**Administrator can select all or single for managed Aps**.**
- **IP Address：** Display IP address for managed AP.
- **MAC Address：**Display MAC address for managed AP.
- **Host Name：**Display host name for managed AP.
- **F/W Version：**Display firmware version for managed AP.
- **F/W Date：**Display firmware Release date for managed AP.
- **IP Address：**Administrator can set single IP address for Managed AP.
- **Netmask：**Administrator can set single Netmask for Managed AP.
- **Default：**Administrator click the button will can reset to default for select managed APs.



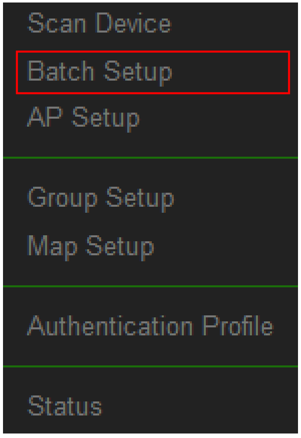
Control Port	VLAN 0 (192.168.2.0/24)
VLAN TAG	□ 1-4096
IP Address	192.168.2.10
Netmask	255.255.255.0

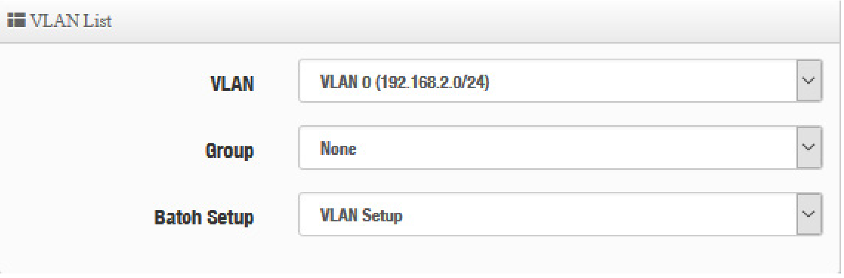
- **Control Port：**Administrator can change VLAN network for managed APs.
- **VLAN TAG：**Administrator can set VLAN TAG ID for managed APs.
- **IP Address：**Administrator can set IP address for managed APs, the IP address is auto-incrementally.
- **NetMask：**Administrator can set NetMask for managed APs.

When the setting managed APs is completed, please click Apply & Reboot button to complete the setup process.

5.2 Batch Setup

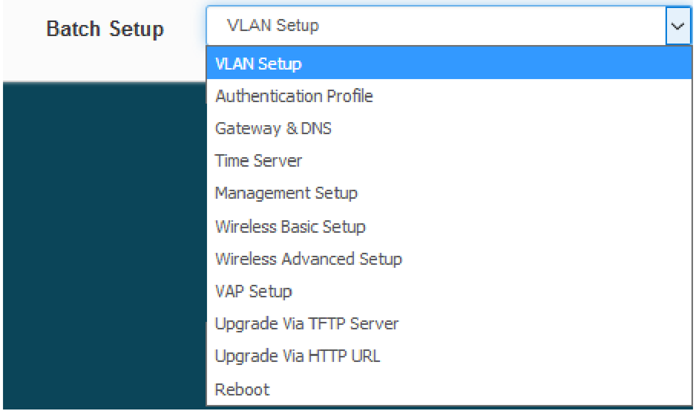
The AP control function supports centralized configuration of managed APs. Administrator can change VLAN network / Group and batch setup for managed APs.





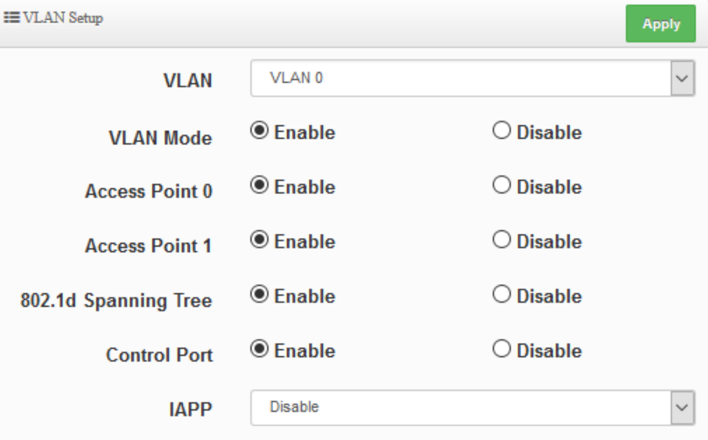
VLAN	VLAN 0 (192.168.2.0/24)
Group	None
Batoh Setup	VLAN Setup

- **VLAN**：When VLAN Tag function is enabled (please refer to 4.1 System VLAN Setup), administrator can change VLAN tag for managed APs.
- **Group**：When AP Groups are created (please refer to 4.2.4 Group setup), Administrators can select and change group settings of managed APs.
- **Batch Setup**：Administrator can centralize setting changes for managed APs.



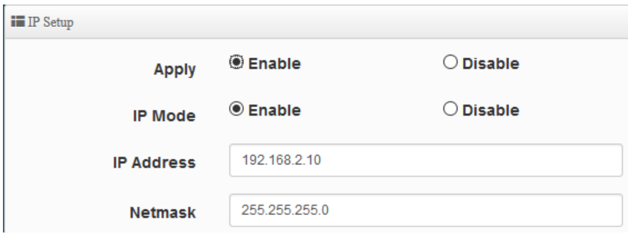
Batch Setup: VLAN Setup

  - **VLAN Setup:** Administrator can set VLAN Tag, IP address and Wi-Fi on/off for the managed APs.



VLAN	VLAN 0	
VLAN Mode	● Enable	○ Disable
Access Point 0	● Enable	○ Disable
Access Point 1	● Enable	○ Disable
802.1d Spanning Tree	● Enable	○ Disable
Control Port	● Enable	○ Disable
IAPP	Disable	

- ✓ **VLAN**：The function can select VLAN (please refer to 3.2 Configure VLAN Setup) for managed APs.
- ✓ **VLAN Mode**：Administrator can enable or disable VLAN mode of the managed APs.
- ✓ **Access Point0/1**：Administrator can enable or disable 2.4 or 5G radio of the managed APs. (Access Point 0 is radio 2.4G, Access Point 1 is radio 5G)
- ✓ **802.1d Spanning Tree**：Administrator can enable or disable the function.(please refer to 3.2.1 Network Button ➔ 802.1d Spanning Tree)
- ✓ **Control Port**：The function administrator can enable or disable of the managed APs (please refer to 3.2.1 Network Button ➔ Control Port)
- ✓ **IAPP**：The function administrator can enable or disable of the managed APs. (Please refer to 3.2.1 Network Button ➔ IAPP)
- ✓ **IP Setup**：Administrator can set IP address and Netmask of the managed APs.



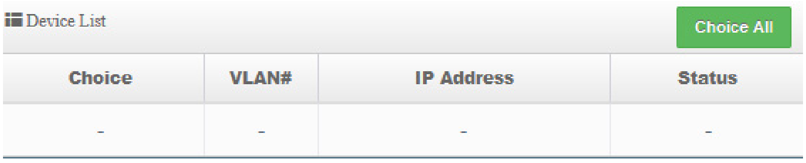
IP Setup

Apply	● Enable	○ Disable
IP Mode	● Enable	○ Disable
IP Address	192.168.2.10	
Netmask	255.255.255.0	

- ✓ **ETH0/1 VLAN Tag Setup**：Administrator can set 802.1Q VLAN Tag or disable VLAN function of the managed APs.

- **Authentication Profile**：After creating Profiles, See: "5.6 Authentication Profile" users can conveniently apply Authentication profiles
- **Gateway & DNS:** Setting Gateway and DNS for managed APs.
- **Time Server:** Setting System Time for managed APs. (Please refer to 3.8 Time Server)
- **Management Setup:** Setting system name/ system login port and system log server service for managed APs. (Please refer to 3.7 system management)
- **Wireless Batch Setup:** Setting Wi-Fi configurations for managed APs.
  (Please refer to 4. Wireless Basic Setup). Different models have some differences in the function, please confirm the product SPEC sheet to support the function to set, other unsupported features can ignore.
- **Wireless** Advanced Setup: Setting Wi-Fi Advanced settings for managed APs. (Please refer to 4.3 Wireless Advanced Setup)
- **VAP Setup**：Wi-Fi SSID / channel or security settings for managed APs. (Please refer to 3.2 VLAN Setup ➔Radio setup)
- **Upgrade via TFTP Server:** Administrator can centrally upgrade firmware via TFTP Server for the managed APs.
- **Upgrade via HTTP Server:** Administrator can centrally upgrade firmware via HTTP Server for the managed APs.
- **Reboot:** Administrator can reboot managed APs.

- **Device List：**Display managed AP list. If want to set single or multiple managed AP, administrator can select managed APs in checkbox.

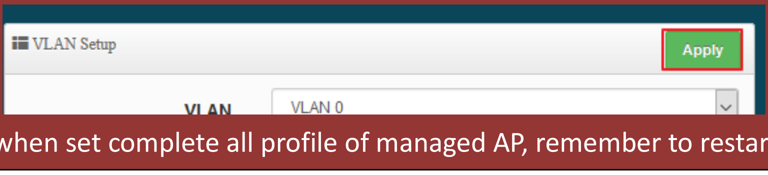


Device List

Choice	VLAN#	IP Address	Status
-	-	-	-

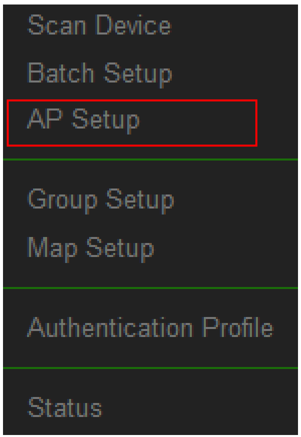
Notice

1. When each function is set, administrator must click on the "Apply" button on the upper right to set the value to take effect

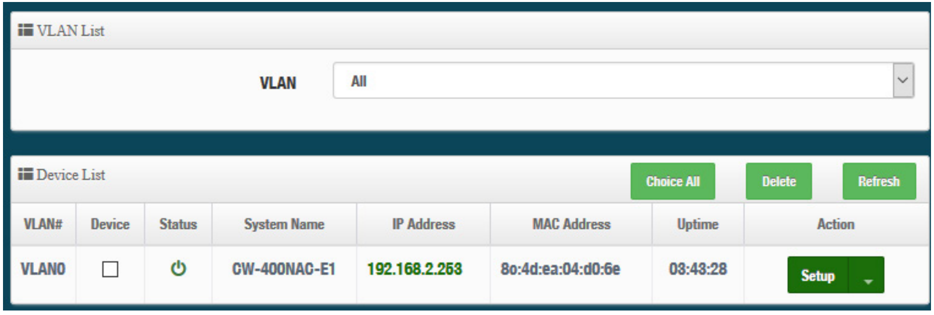


2. when set complete all profile of managed AP, remember to restart managed AP

5.3 AP Setup



Administrator can monitor statuses and modify managed APs information.



VLAN List

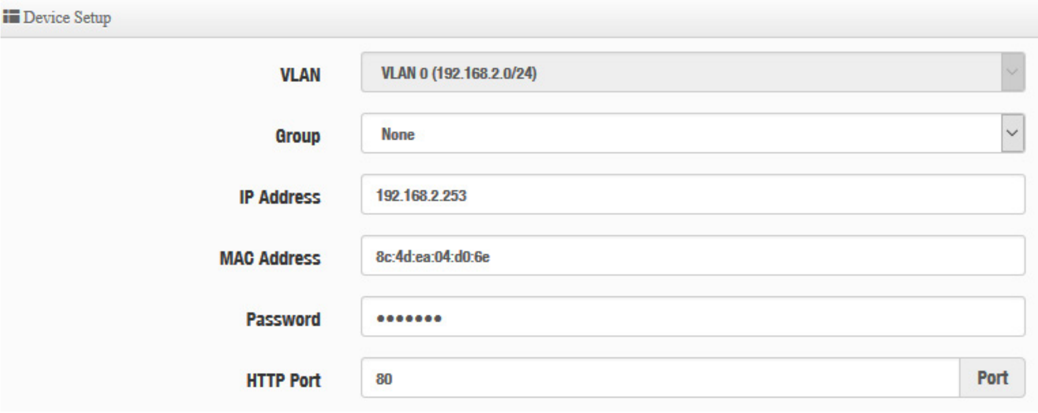
VLAN: All

Device List

VLAN#	Device	Status	System Name	IP Address	MAC Address	Uptime	Action
VLAN0	☐	⏻	CW-400NAC-E1	192.168.2.253	8o:4d:ea:04:d0:6e	03:43:28	Setup

➢ **VLAN：**Select desired VLAN for AP setup

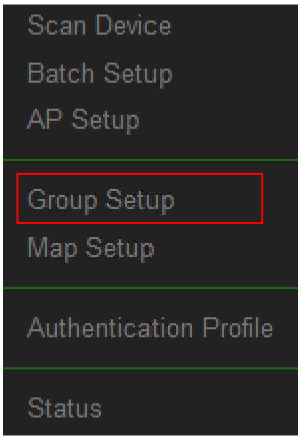
- **Setup：**Administrator can modify IP addresses, system login passwords, and web login port for managed APs. If administrator has change AP devices, administrator can modify MAC address of the new managed AP.



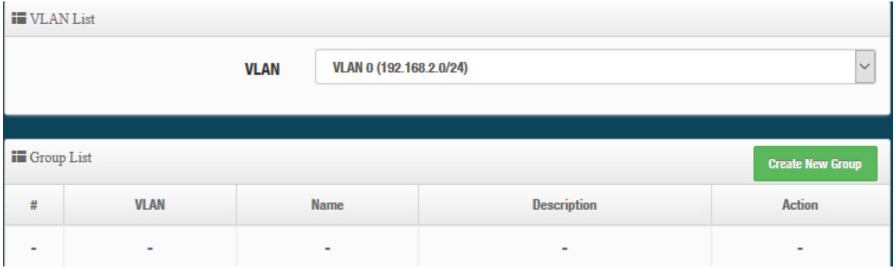
Device Setup

VLAN	VLAN 0 (192.168.2.0/24)
Group	None
IP Address	192.168.2.253
MAC Address	8c:4d:ea:04:d0:6e
Password	•••••••
HTTP Port	80 Port

5.4 Group Setup



Administrator can create Groups within the same VLAN.



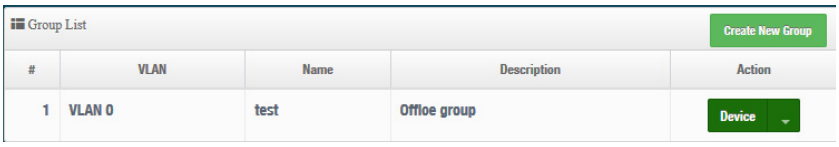
VLAN List

VLAN	VLAN 0 (192.168.2.0/24)

Group List

#	VLAN	Name	Description	Action
-	-	-	-	-

- **VLAN：**Select VLAN.
- **Create New Group：**Click the button to create a new AP Group

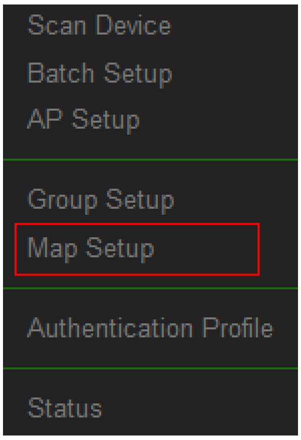


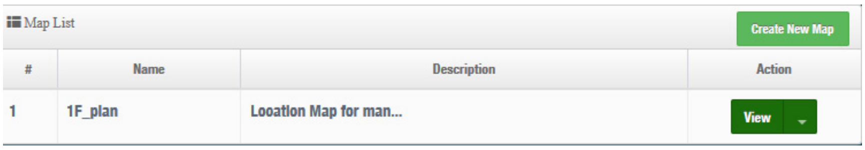
Group List

#	VLAN	Name	Description	Action
1	VLAN 0	test	Offioe group	Device

- **Device button：**Administrator can select managed APs and import them into the Group.

5.5 Map Setup





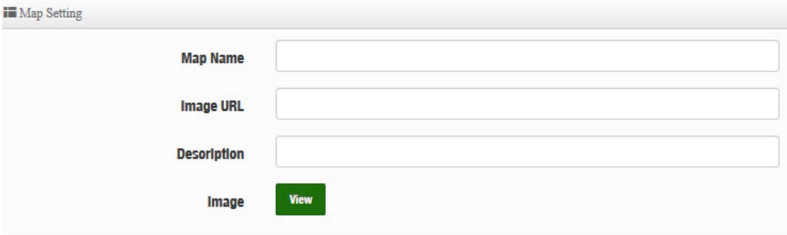
Map List

Create New Map

#	Name	Description	Action
1	1F_plan	Location Map for man...	View

The Map Setup feature allows administrators to upload a floor plan image to a web server, then use the image URL to import the map into the AP user interface. Once the image is uploaded, administrators can use the Map Setup function to map out the locations of the AP network.

➢ **Create New Map**：Click the button to create map.



Map Setting

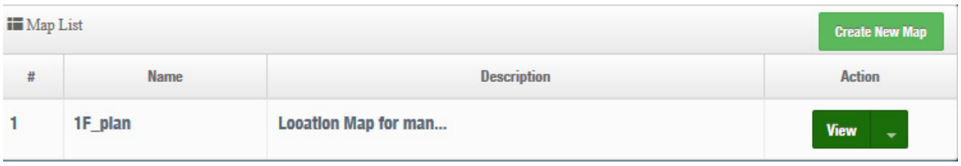
Map Name

Image URL

Description

Image View

- **Map Name**：Enter map name.
- **Image URL**：Paste Map image url
- **Description**：Enter the description for the map.
- **Image:** View button. When administrator set complete of Image URL then can click view button to view image, After the Map URL setup confirmation, please reboot the system.



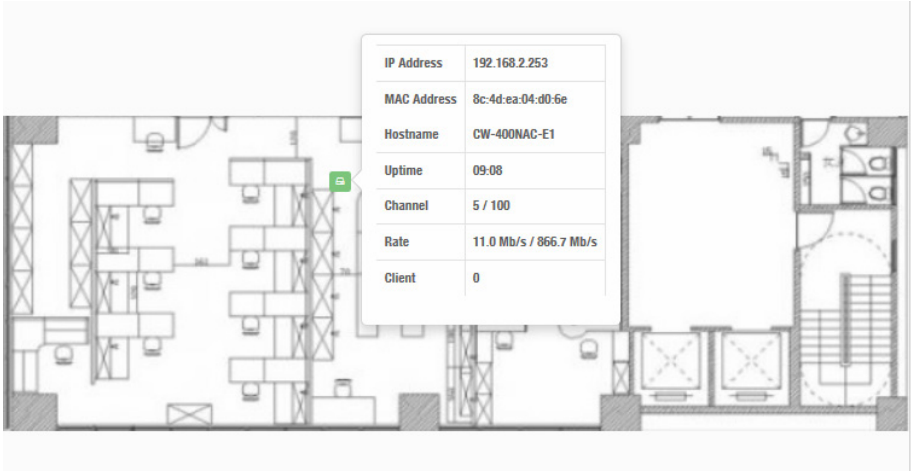
Map List

Create New Map

#	Name	Description	Action
1	1F_plan	Location Map for man...	View

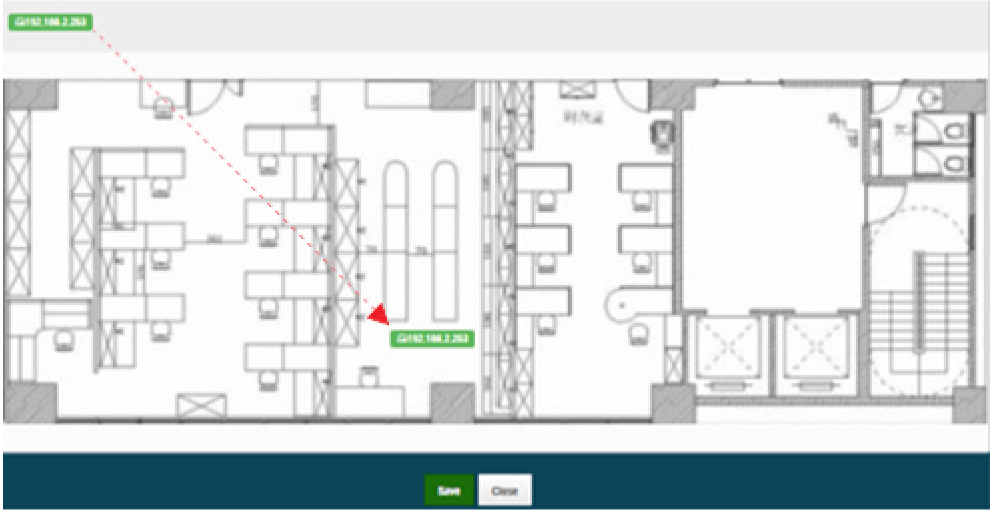
➢

: Once complete, administrators can click the “View” button to monitor AP statuses and locations.

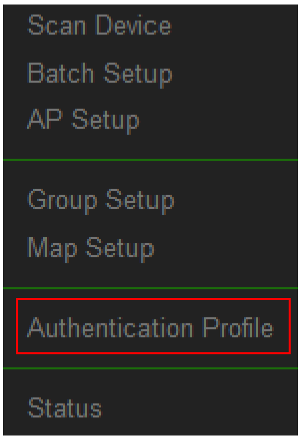


IP Address	192.168.2.253
MAC Address	8c:4d:ea:04:d0:6e
Hostname	CW-400NAC-E1
Uptime	09:08
Channel	5 / 100
Rate	11.0 Mb/s / 866.7 Mb/s
Client	0

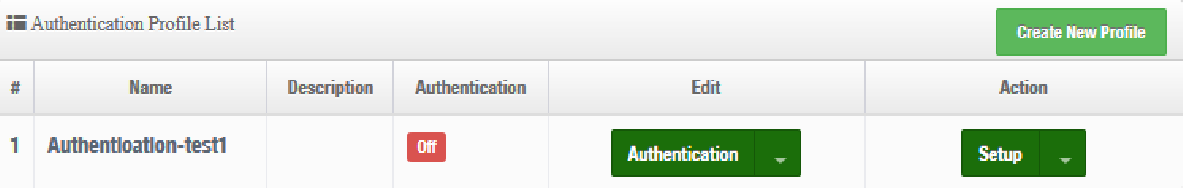
- View ▾ : Once the Map is created and properly in the Map List, administrators can click the “Layout” button in the action tab to map out the AP network. Managed APs will appear in the “Device List” section of the layout page. Administrators can simply drag the AP (IP Address) to the correct installation location.



5.6 Authentication Profile



Administrator can pre-set authentication conditions in the profile, the authentication set can refer 3 Authentication.



Authentication Profile List

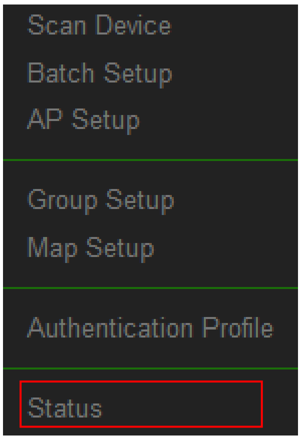
Create New Profile

#	Name	Description	Authentication	Edit	Action
1	Authentloatlon-test1		Off	Authentication ⌄	Setup ⌄

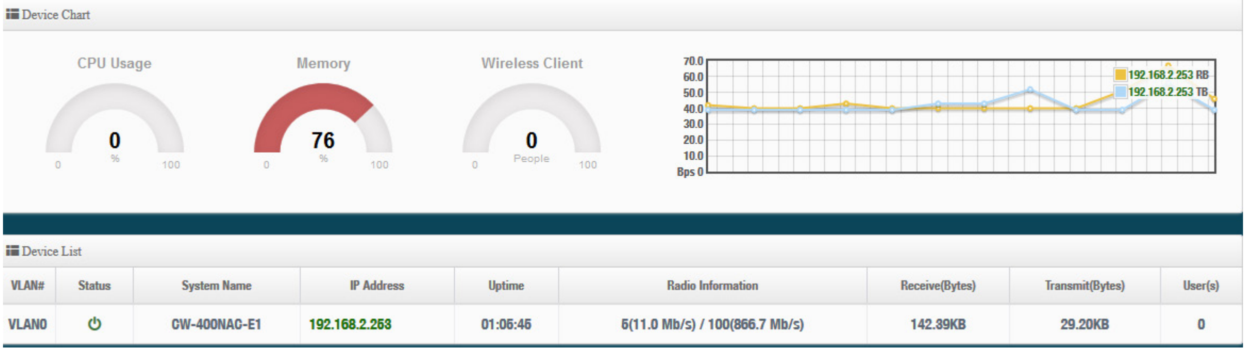
- **Create New Profile**：Administrator can create authentication profile.
- **Edit**： Authentication ⌄ Click the Authentication button to Enable or Disable authentication function. For more details, refer to **"3.4.1 Enable Authentication function".**

  Authentication ⌄ Click Dropdown to set authentication functions. Refer to **"3.4.2 Set Authentication function"** dropdown functions.
- **Action:** Setup ⌄ The button can modify or delete for the authentication profile.

5.7 Status



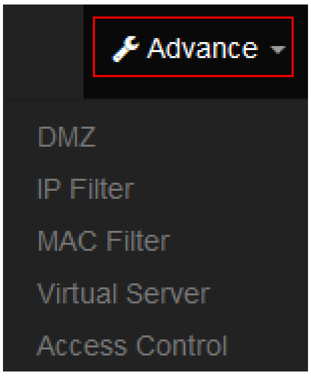
Administrator can monitor Tx/Rx flow information, show online users and check system CPU / Memory information and on/off line for the managed APs. The information data display support graphical interface.



Device List

VLAN#	Status	System Name	IP Address	Uptime	Radio Information	Receive(Bytes)	Transmit(Bytes)	User(s)
VLAN0	⏻	CW-400NAC-E1	192.168.2.253	01:06:45	5(11.0 Mb/s) / 100(866.7 Mb/s)	142.39KB	29.20KB	0

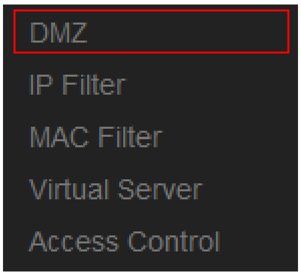
6. Advanced

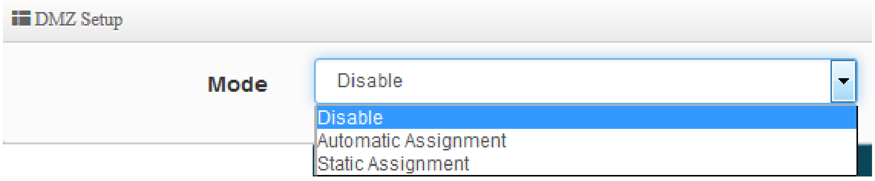


Notice — This function used to operate in **Router and WISP** mode, Other mode will not be supported for this function.

6.1 DMZ

DMZ is commonly work with the NAT functionality as an alternative of Virtual Server(Port Forwarding*)* while wanting all ports of DMZ host visible to Internet users. Virtual Server rules have precedence over the DMZ rule. In order to use a range of ports available to access to different internal hosts Virtual Server rules are needed.

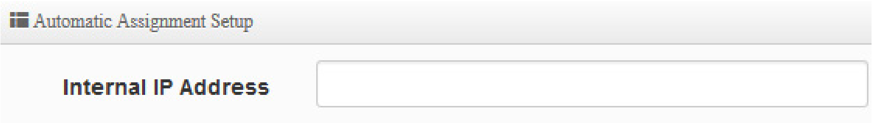




DMZ Setup

Mode: Disable

- **Automatic Assignment:** Enter Internal IP address of DMZ host and only one DMZ host is supported.

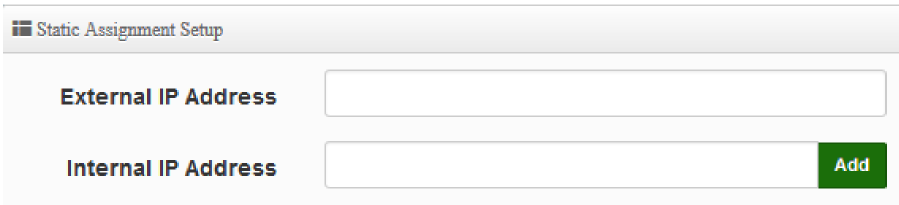


Automatic Assignment Setup

Internal IP Address	

- ● **Internal IP Address:** Enter Virtual IP for service device.

- **Static Assignment:** Enter external and internal IP address of DMZ host. The function only external IP to Internal IP address



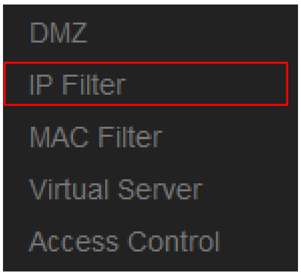
Static Assignment Setup

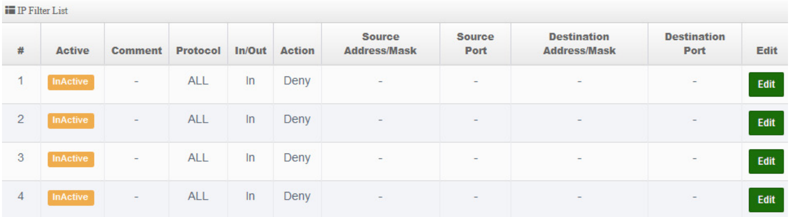
External IP Address	
Internal IP Address	Add

- ● **External IP Address:** Enter external IP address
- ● **Internal IP Address:** Enter Virtual IP for service device.

6.2 IP Filter

Can allow or deny filter ingress or egress packets from specific source and/or to destination IP address on wired (LAN) or Wireless (WAN) ports. Filter rules could be used to filter unicast or multicast packets on different protocols as shown in the IP Filter Setup. Important to note that IP filter rules has precedence over Virtual server rules.

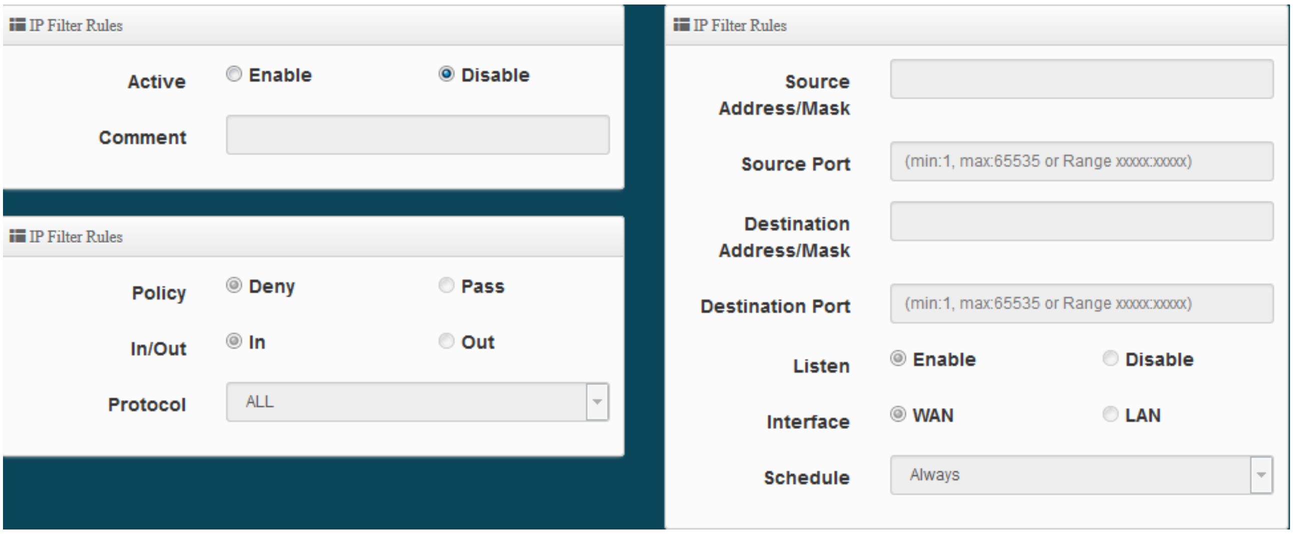




IP Filter List

#	Active	Comment	Protocol	In/Out	Action	Source Address/Mask	Source Port	Destination Address/Mask	Destination Port	Edit
1	InActive	-	ALL	In	Deny	-	-	-	-	Edit
2	InActive	-	ALL	In	Deny	-	-	-	-	Edit
3	InActive	-	ALL	In	Deny	-	-	-	-	Edit
4	InActive	-	ALL	In	Deny	-	-	-	-	Edit

Please click **Edit** button to setting IP filter.



IP Filter Rules

Active ○ Enable ● Disable

Comment

IP Filter Rules

Policy ● Deny ○ Pass

In/Out ● In ○ Out

Protocol ALL

IP Filter Rules

Source Address/Mask

Source Port (min:1, max:65535 or Range xxxxx:xxxxx)

Destination Address/Mask

Destination Port (min:1, max:65535 or Range xxxxx:xxxxx)

Listen ● Enable ○ Disable

Interface ● WAN ○ LAN

Schedule Always

- **Active:** Administrator can select Enable or Disable the service.
- **Comment:** Enter the description of IP filter rule.
- **Policy:** Administrator can select the IP flow rule of Deny or Pass.
- **In/ Out:** Administrator can select the IP flow rule of In/out bound.
- **Protocol:** Set used service Port of **TCP**, **UDP** or **ICMP**.
- **Source Address/Mask:** Enter desired source IP address and netmask. i.e. 192.168.2.10/32 or 192.168.2.10/255.255.255.0
- **Source Port:** Enter a port or a range of ports as **start:end**. i.e. port 20:80
- **Destination Address/Mask:** Enter desired destination IP address and netmask. *i.e.* 192.168.1.10/32 or 192.168.2.10/255.255.255.0
- **Destination Port:** Enter a port or a range of ports as **start:end.** i.e. port 20:80
- **Listen:** Select Enable radial button to match TCP packets only with the SYN flag.
- **Interface:** The interface that a filter rule applies.
- **Schedule:** Can choose to use rule by **"Time Policy".**

Notice	All packets are allowed by default. Deny rules could be added to the filter list to filter out unwanted packets and leave remaining allowed.

When you create rules in the IP Filter List, the prior rules maintain higher priority. To allow limited access from a subnet to a destination network manager needs to create allow rules first and followed by deny rules. So, if you just want one IP address to access the system via telnet from your subnet, not others, the Example 1 demonstrates it, not rules in the Example 2.

Example 1:

Create a higher priority rule to allow IP address 192.168.2.2 Telnet access from LAN port first, and deny Telnet access from remaining IP addresses in the same subnet.

Rule	Source		Destination		In/Out	Protocol	Listen	Action	Side
	IP/Mask	Port	IP/Mask	Port					
1	192.168.2.2/32		192.168.2.254/32	22	**In**	TCP	**n**	Pass	LAN
2	192.168.2.0/24		192.168.2.254/32	22	**In**	TCP	**n**	Deny	LAN

Example 2:

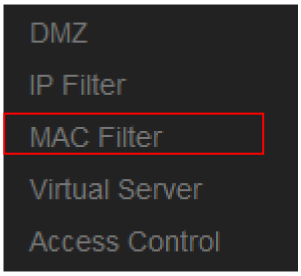
All Telnet access to the system from the IP addresses of subnet 192.168.2.x works with the rule 1 of Example 2. The rule 2 won't make any difference.

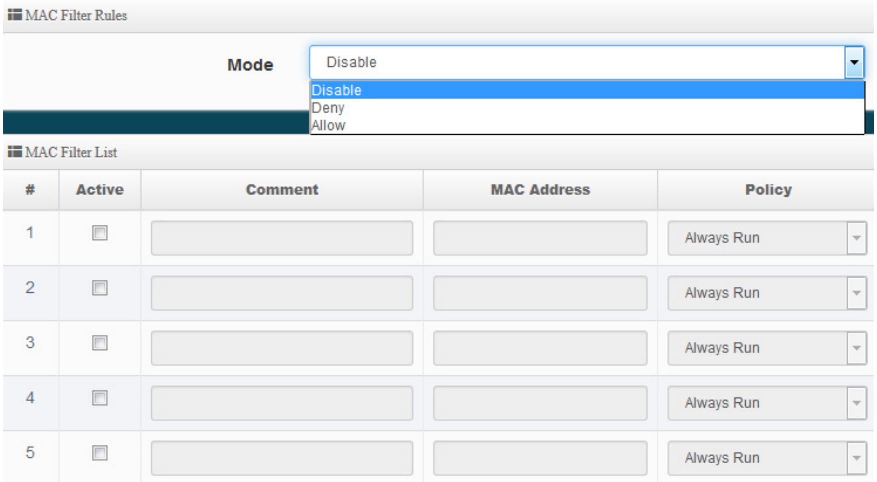
Rule	Source		Destination		In/Out	Protocol	Listen	Action	Side
	IP/Mask	Port	IP/Mask	Port					
1	192.168.2.0/24		192.168.2.254/32	22	**In**	TCP	**n**	Pass	LAN
2	192.168.2.2/32		192.168.2.254/32	22	**In**	TCP	**n**	Deny	LAN

Click "**Save**" button to add IP filter rule. Total of **20** rules maximum allowed in the IP Filter List. All rules can be edited or removed from the List. Click ***Reboot*** button to activate your changes.

6.3 MAC Filter

Allows creating MAC filter rules to allow or deny unicast or multicast packets from limited number of MAC addresses. Important and must note. That MAC filter rules have precedence over IP Filter rules.





MAC Filter Rules

Mode: Disable

- Disable
- Deny
- Allow

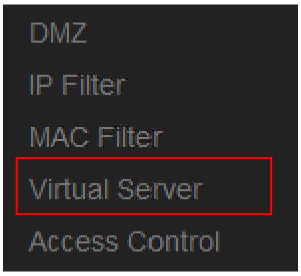
MAC Filter List

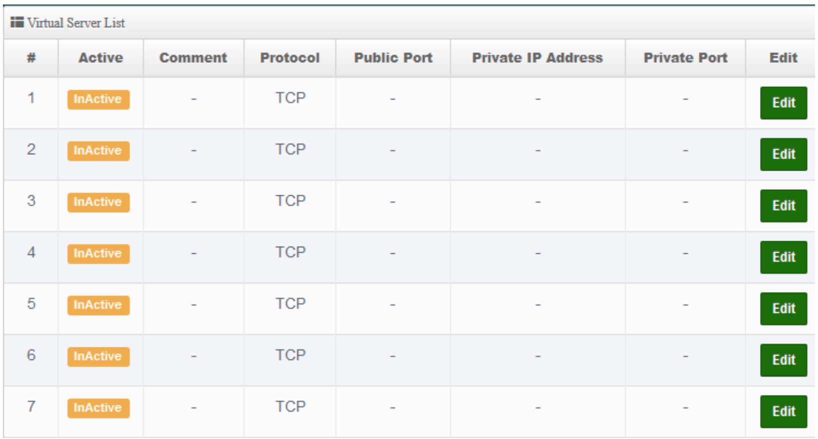
#	Active	Comment	MAC Address	Policy
1	☐			Always Run
2	☐			Always Run
3	☐			Always Run
4	☐			Always Run
5	☐			Always Run

- **Mode:** Administrator can select Deny or Allow.
  - **Deny:** The MAC Filter List will be **denied** to access (LAN to WAN). Others will be allowed.
  - **Allow:** The MAC Filter List will be **allowed** to access (LAN to WAN). Others will be denied.
- **Comment:** Enter the description of MAC filter rule.
- **MAC Address:** Enter MAC address (e.g. aa:bb:cc:00:00:0a) and click "**Add**" button, then the MAC address should display in the MAC Filter List.
- **Policy:** Administrator can select to use rule by **"Time Policy".**

6.4 Virtual Server

The **"Virtual Server"** can also referred to as "Port Forward" as well and used interchangeably. Resources in the network can be exposed to the Internet users in a controlled manner including on-line gaming, video conferencing or others via Virtual Server setup. Don't repeat ports' usage to avoid confusion. Suppose you want to assign ports 21-25 to one FTP, Telnet and SMTP server (A in the example), and port 80 to another (B in the example). You assign the LAN IP addresses and the ISP assigns the WAN IP address. The NAT network appears as a single host on the Internet.

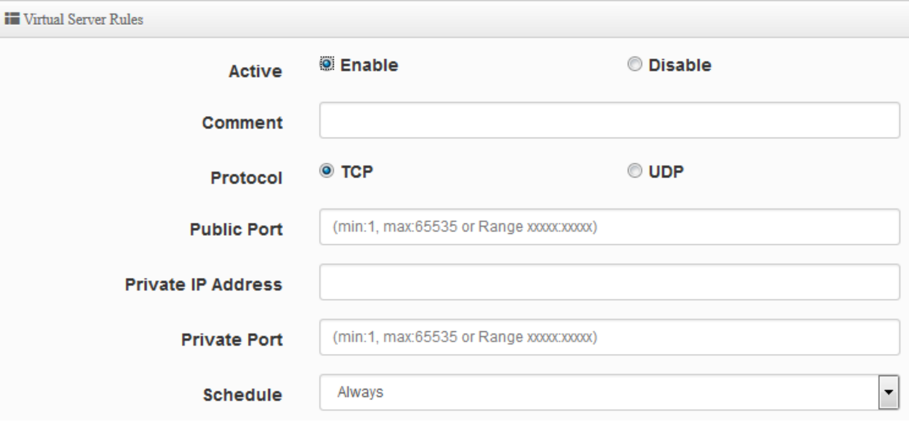




Virtual Server List

#	Active	Comment	Protocol	Public Port	Private IP Address	Private Port	Edit
1	InActive	-	TCP	-	-	-	Edit
2	InActive	-	TCP	-	-	-	Edit
3	InActive	-	TCP	-	-	-	Edit
4	InActive	-	TCP	-	-	-	Edit
5	InActive	-	TCP	-	-	-	Edit
6	InActive	-	TCP	-	-	-	Edit
7	InActive	-	TCP	-	-	-	Edit

Please click **Edit** button to setting Virtual Server rules.



Virtual Server Rules

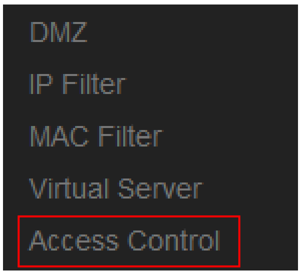
Active	● Enable	○ Disable
Comment		
Protocol	● TCP	○ UDP
Public Port	(min:1, max:65535 or Range xxxxx:xxxxx)	
Private IP Address		
Private Port	(min:1, max:65535 or Range xxxxx:xxxxx)	
Schedule	Always	

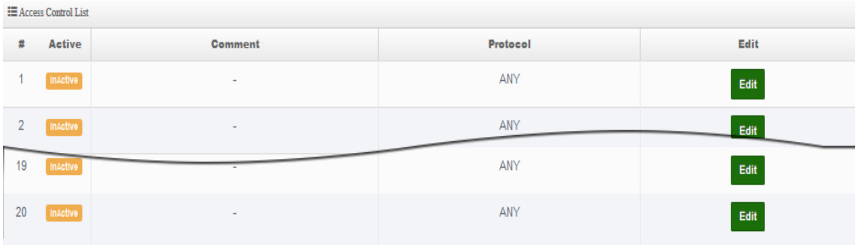
- **Active:** Administrator can select Virtual server rule to Enable or disable.
- **Comment:** Enter the description of virtual server rule.
- **Protocol:** Administrator can select service protocol of TCP or UDP.
- **Public Port:** Enter service port No. for public.
- **Private IP Address:** Enter corresponding IP address for internal.
- **Private Port:** Enter internal service port No. for private.
- **Schedule :** Administrator can select to used rule of **"Time Policy"**

6.5 Access Control

The Access Control function administrator can to block or allow specific kinds of TCP/UDP/ICMP protocol, such as Internet access, designated services, and websites. The Access Control function can set 20 profiles.

Please click on **Advance -> Access Control** and follow the below setting.

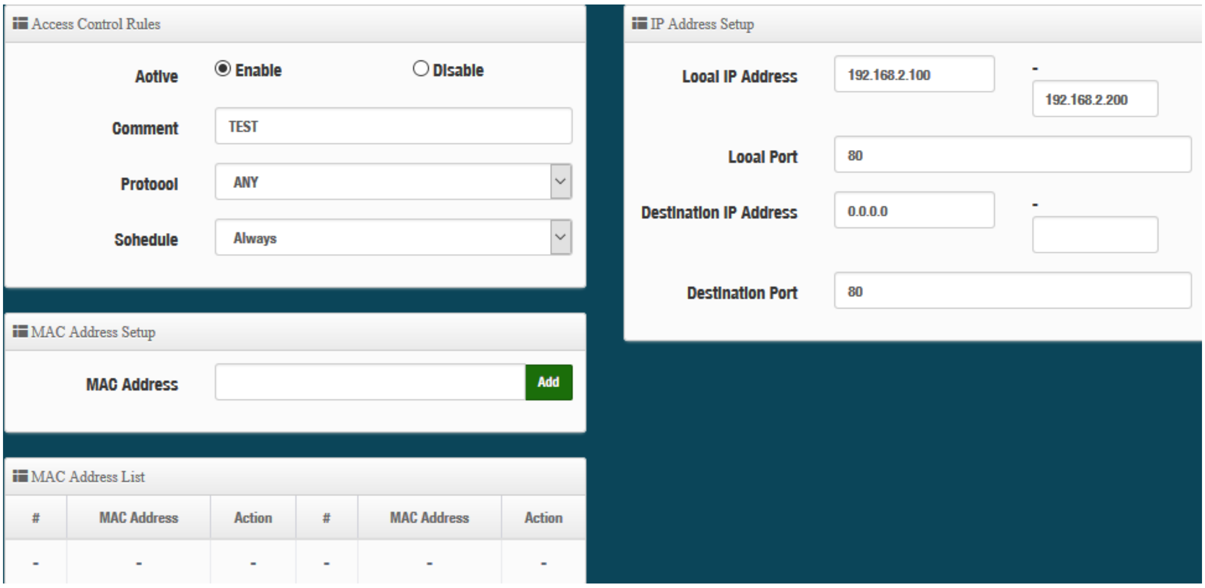




Access Control List

#	Active	Comment	Protocol	Edit
1	InActive	-	ANY	Edit
2	InActive	-	ANY	Edit
19	InActive	-	ANY	Edit
20	InActive	-	ANY	Edit

- **#：** Display access control list.
- **Active：** Display Active or InActive for the access control rule.
- **Comment:** Display information for the rule.
- **Protocol：** Display information for the protocol.
- **Edit：** Administrator can click the button to set Access Control rule.



Access Control Rules

Active ● Enable ○ Disable

Comment: TEST

Protocol: ANY

Schedule: Always

MAC Address Setup

MAC Address: [ ] Add

MAC Address List

#	MAC Address	Action	#	MAC Address	Action
-	-	-	-	-	-

IP Address Setup

Local IP Address: 192.168.2.100 - 192.168.2.200

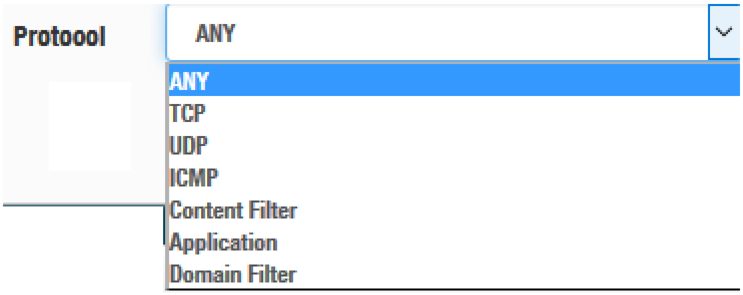
Local Port: 80

Destination IP Address: 0.0.0.0 -

Destination Port: 80

# Access control rules：

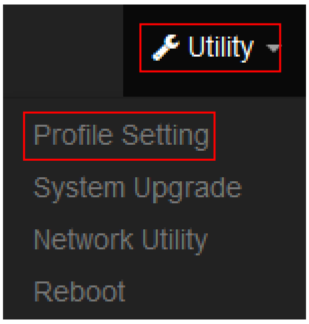
- **Active：** Administrator can select Enable or Disable for the Access control rule.
- **Comment：** Administrator can enter comment for the role.
- **Protocol：** Administrator can to select management protocol by TCP/UDP/ICMP/Content Filter/Application and Domain Filter.



- ✓ **ANY:** Select **"Any"** is all deny Protocol, administrator can filter local IP / IP range go to destination IP / IP range and use protocol.
- ✓ **TCP:** Deny TCP Protocol, Administrator can set TCP protocol and assign IP / IP range.
- ✓ **UDP:** Deny UDP Protocol, Administrator can set UDP protocol and assign IP / IP range.
- ✓ **ICMP:** Deny ICMP Protocol, Administrator can assign IP / IP range.
- ✓ **Content Filter:** Administrator can set web Keyword to filter.
- ✓ **Application:** System built-in multiple applications data, Administrator can select application data to filter.
- ✓ **Domain:** Administrator can set domain name to filter.
  - **Schedule：** The rule can apply Time Policy.

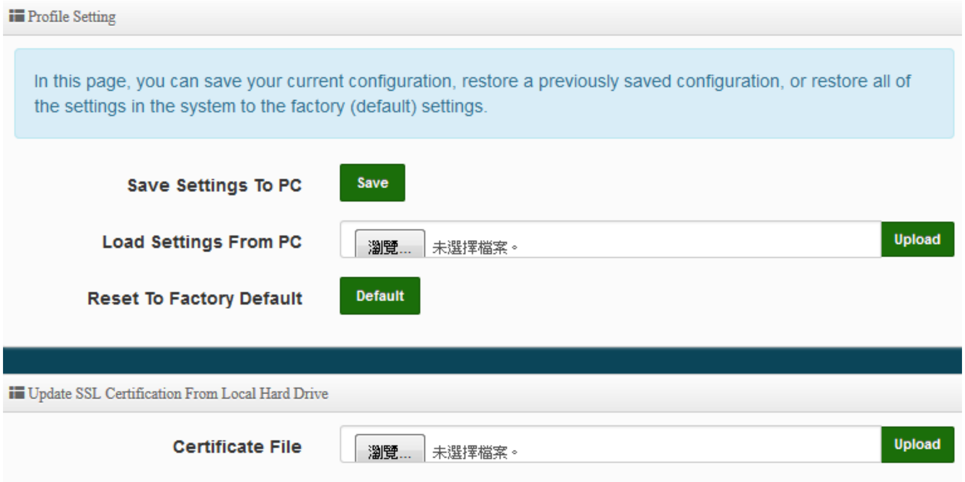
7. Utilities

7.1 Profile Setting



This Functions purpose is to backup current configuration, restore prior configuration or reset back to factory default configurations.

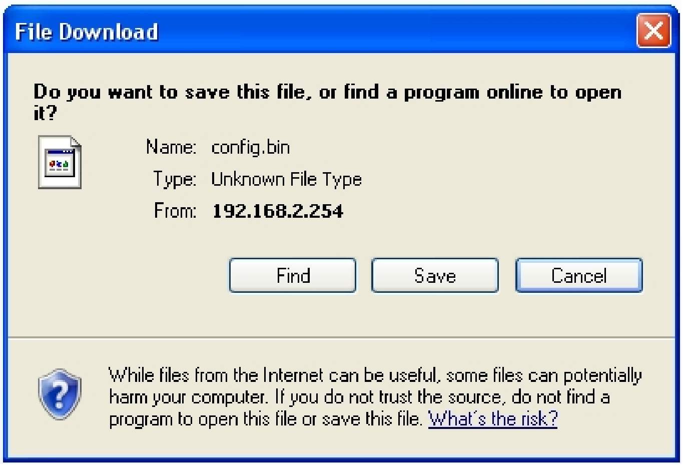
Please click on **Utilities -> Profile Setting** and follow the below setting



Profile Setting

In this page, you can save your current configuration, restore a previously saved configuration, or restore all of the settings in the system to the factory (default) settings.

- **Save Settings to PC:** Click ***Save*** button to save the current configuration to a local disk.



File Download

Do you want to save this file, or find a program online to open it?

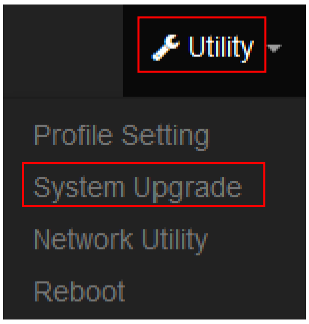
Name: config.bin
Type: Unknown File Type
From: **192.168.2.254**

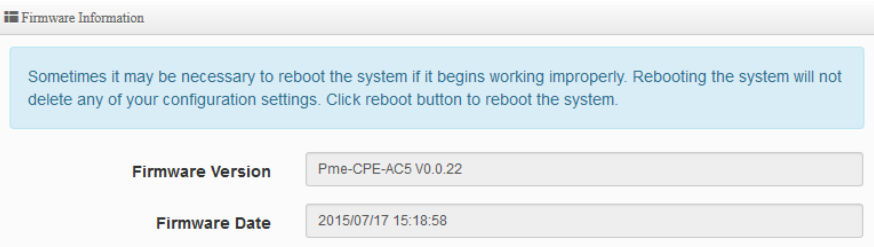
While files from the Internet can be useful, some files can potentially harm your computer. If you do not trust the source, do not find a program to open this file or save this file. What's the risk?

- **Load Settings from PC:** Click ***Browse*** button to locate a configuration file to restore, and then click ***Upload*** button to upload.
- **Reset To Factory Default:** Click ***Default*** button to reset back to the factory default settings and expect **Successful** loading message**.** Then, click ***Reboot*** button to activate.

7.2 System Upgrade

Firmware is the main software image that system needs to respond to requests and to manage real time operations. Firmware upgrades are sometimes required to include new features or bugs fix. It takes around 2 minutes to upgrade due to complexity of firmware. To upgrade system firmware, click Browse button to locate the new firmware, and then click Upgrade button to upgrade.





Firmware Information

Sometimes it may be necessary to reboot the system if it begins working improperly. Rebooting the system will not delete any of your configuration settings. Click reboot button to reboot the system.

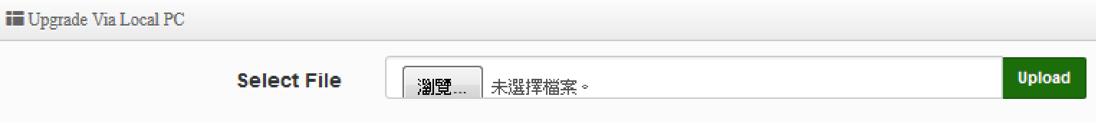
Firmware Version	Pme-CPE-AC5 V0.0.22
Firmware Date	2015/07/17 15:18:58

Firmware Information:

Display the system firmware information.

Upgrade Via Local PC and TFTP Server:

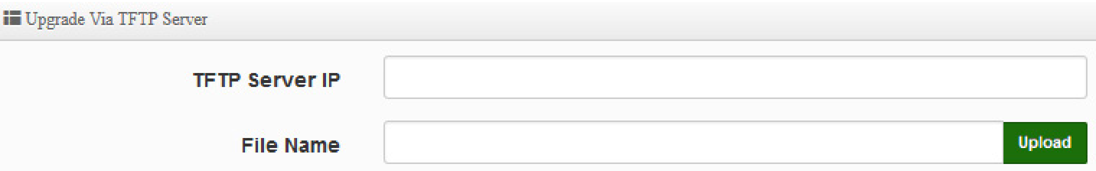
The upgrade firmware will support via local PC and TFTP Server and HTTP URL to upgrade system.



Upgrade Via Local PC

Select File 瀏覽... 未選擇檔案。

- **Select File:** Administrator can select Firmware file in Local PC.



Upgrade Via TFTP Server

TFTP Server IP

File Name

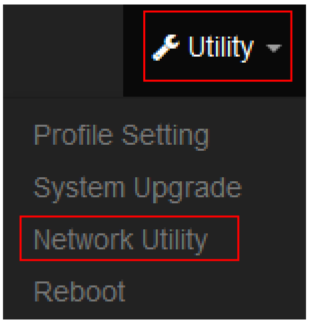
- **TFTP Server:** Enter IP address for TFTP Server.
- **File Name:** Enter file name.

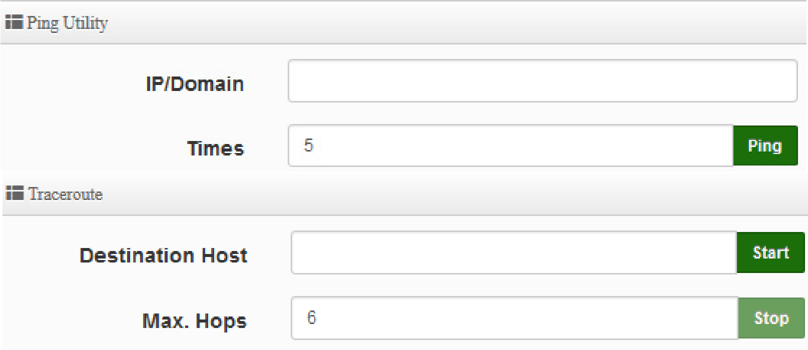
Notice

1. *To prevent data loss during firmware upgrade, please back up current settings before proceeding*
2. *Do not interrupt during firmware upgrade including power on/off as this may damage system.*

7.3 Network Utility

The administrator can diagnose network connectivity via the PING or TRACEROUTE utility. Please click on **Utilities** -> **Network Utility** and follow the below setting.





Ping Utility

IP/Domain

Times 5 Ping

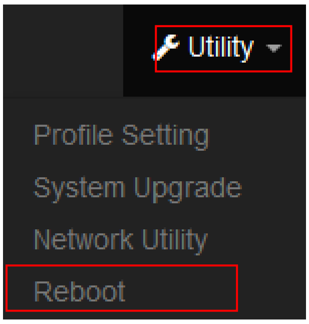
Traceroute

Destination Host Start

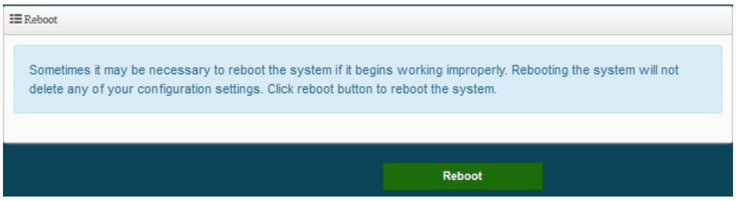
Max. Hops 6 Stop

- **Ping**: This utility will help ping other devices on the network to verify connectivity. Ping utility, using ICMP packets, detects connectivity and latency between two network nodes. As result of that, packet loss and latency time are available in the **Result** field while running the PING test.
  - **IP/Domain**： Enter desired domain name, i.e. www.google.com, or IP address of the destination, and click ping button to proceed. The ping result will be shown in the Result field.
  - **Count**： By default, its 5 and the range is from 1 to 50. It indicates number of connectivity test.
- **Traceroute**： Allows tracing the hops from the CenOS 5.0 AP device to a selected outgoing IP address. It should be used for the finding the route taken by ICMP packets across the network to the destination host. The test is started using the **Start** button, click **Stop** button to stopped test.
  - **Destination Host**: Specifies the Destination Host for the finding the route taken by ICMP packets across the network.
  - **MAX Hop**: Specifies the maximum number of hops (max time-to-live value) trace route will probe.

7.4 Reboot



This function allows user to restart system with existing or most current settings when changes are made. Click **Reboot** button to proceed and take around three minutes to complete.



Reboot

Sometimes it may be necessary to reboot the system if it begins working improperly. Rebooting the system will not delete any of your configuration settings. Click reboot button to reboot the system.

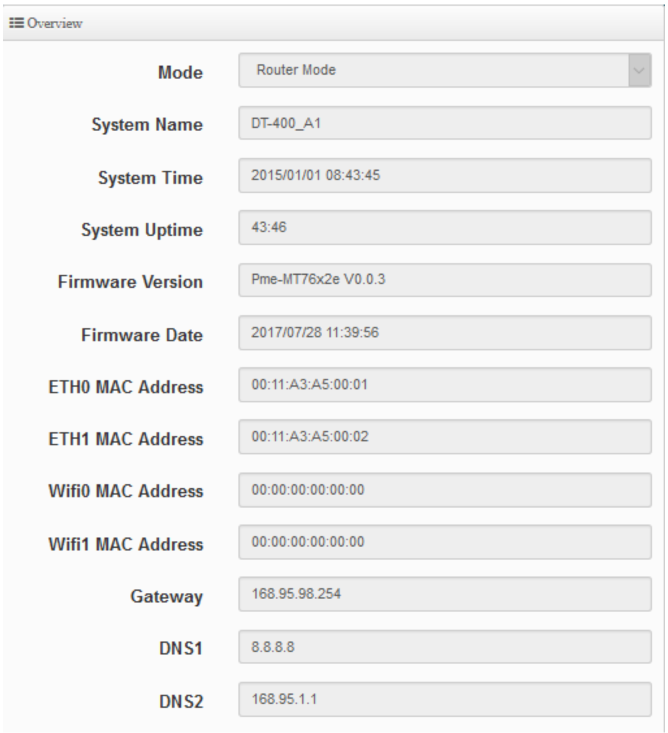
Reboot

8. Status

Different modes have different information display

8.1 Overview

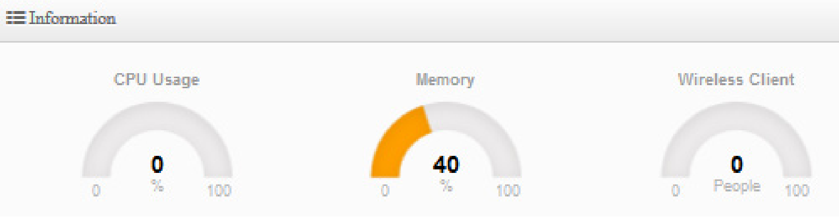
Display system information includes current use mode / system name / system time / firmware information and device MAC address etc.



☰ Overview

Mode	Router Mode
System Name	DT-400_A1
System Time	2015/01/01 08:43:45
System Uptime	43:46
Firmware Version	Pme-MT76x2e V0.0.3
Firmware Date	2017/07/28 11:39:56
ETH0 MAC Address	00:11:A3:A5:00:01
ETH1 MAC Address	00:11:A3:A5:00:02
Wifi0 MAC Address	00:00:00:00:00:00
Wifi1 MAC Address	00:00:00:00:00:00
Gateway	168.95.98.254
DNS1	8.8.8.8
DNS2	168.95.1.1

Information：

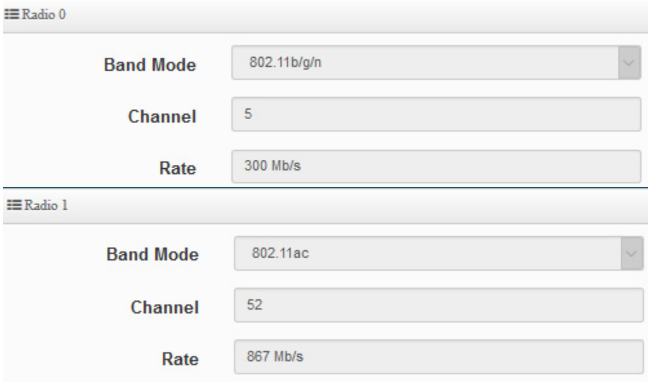


☰ Information

CPU Usage: 0 %
Memory: 40 %
Wireless Client: 0 People

Display system use CPU / Memory information, and Wi-Fi client connection information of **Access Point** / **Route**r mode

If used to operate in **Access Point** / **Route**r mode then display Radio 0/1 information, as follow



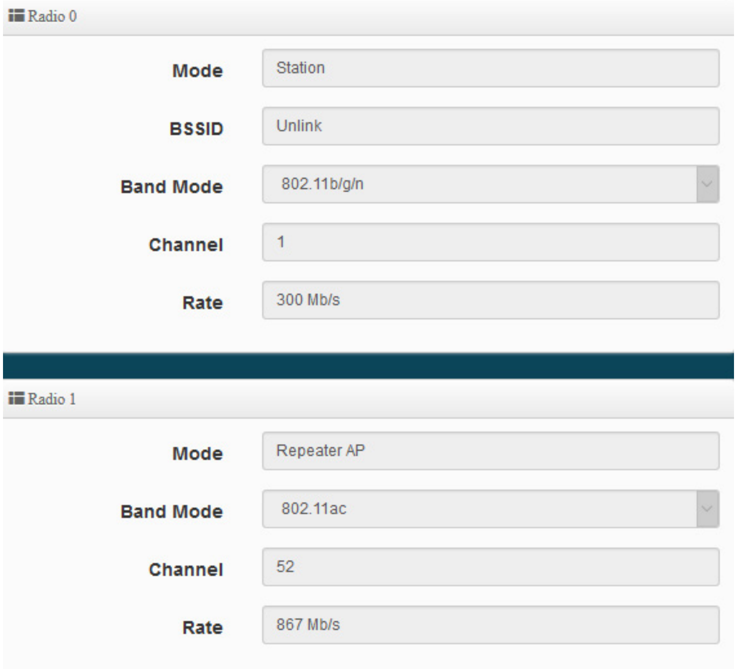
☰ Radio 0

Band Mode	802.11b/g/n
Channel	5
Rate	300 Mb/s

☰ Radio 1

Band Mode	802.11ac
Channel	52
Rate	867 Mb/s

If used to operate in **Client Bridge** / **WISP** mode then display Radio 0/1 information, as follow



Radio 0

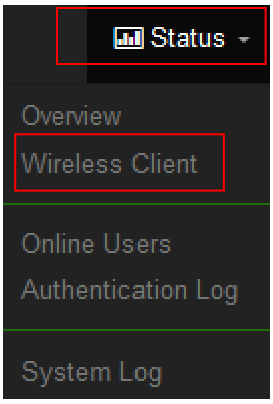
Mode	Station
BSSID	Unlink
Band Mode	802.11b/g/n
Channel	1
Rate	300 Mb/s

Radio 1

Mode	Repeater AP
Band Mode	802.11ac
Channel	52
Rate	867 Mb/s

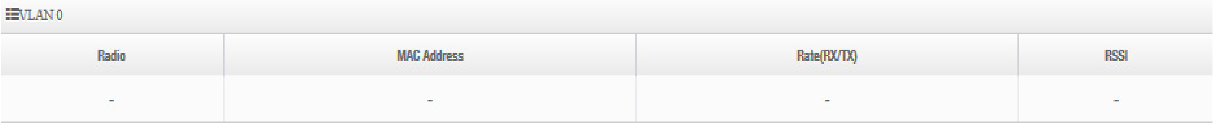
- **Mode:** If radio 0 or 1 used Bridge then system will display station mod, if used repeater then will display Repeater AP.

8.2 Wireless Client



Notice	Only for CAP mode have not wireless client status

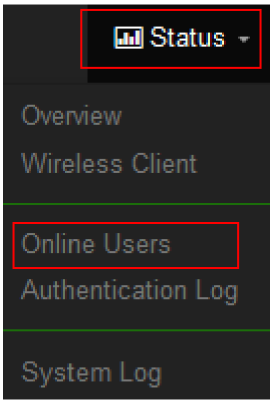
The page can be display Wireless user information link to access point. Administrator can monitor MAC address / rate and RSSI for the wireless users.



VLAN 0

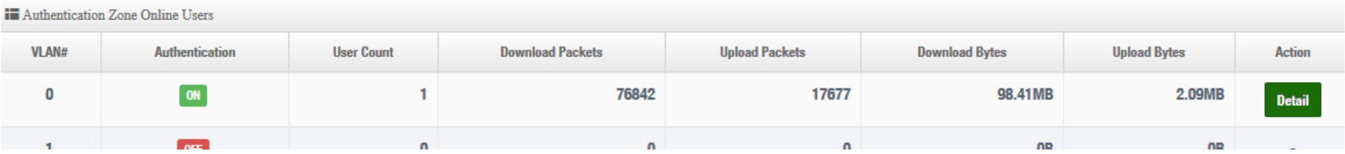
Radio	MAC Address	Rate(RX/TX)	RSSI
-	-	-	-

8.3 Online Users by Captive Portal



Notice | Display online users status only in Access point mode

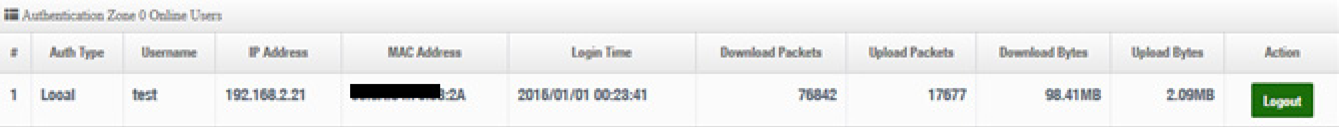
The status can display online users by Captive Portal. Administrator can monitor user’s login / logout time and account type for the authentication account.



Authentication Zone Online Users

VLAN#	Authentication	User Count	Download Packets	Upload Packets	Download Bytes	Upload Bytes	Action
0	ON	1	76842	17677	98.41MB	2.09MB	Detail
1	OFF	0	0	0	0B	0B	-

- **VLAN#：** Display VLAN number.
- **Authentication：** Display Captive Portal authentication function is on/off in the VLANs.
- **Users Count：** Display the VLAN network connected user’s amount.
- **Download Packets：** Display total download packets amount information of the VLAN.
- **Upload Packets：** Display total upload packets amount information of the VLAN.
- **Download Bytes：** Display total download flow information of the VLAN.
- **Upload Bytes：** Display total upload flow information of the VLAN.
- **Action：** Administrator can click **“Detail”** button to monitor all user’s use network information.

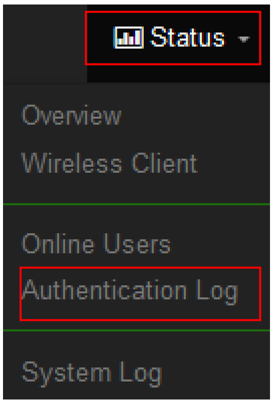


Authentication Zone 0 Online Users

#	Auth Type	Username	IP Address	MAC Address	Login Time	Download Packets	Upload Packets	Download Bytes	Upload Bytes	Action
1	Local	test	192.168.2.21	[redacted]:2A	2016/01/01 00:23:41	76842	17677	98.41MB	2.09MB	Logout

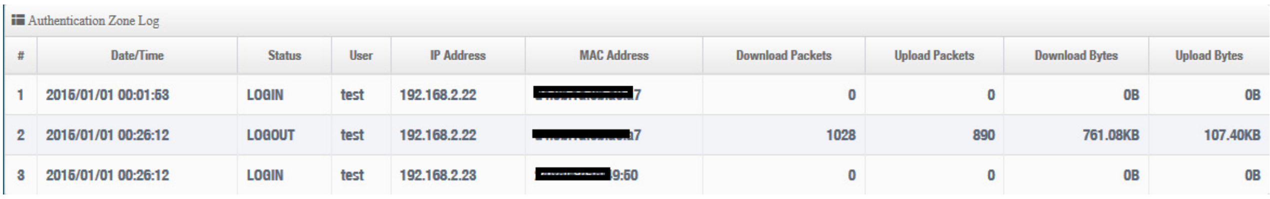
- **Auth Type：** Display authentication login type.
- **User name：** Display authentication account.
- **IP Address：** Display IP address for user.
- **MAC Address：** Display MAC address for user.
- **Download Packets：** Display total download packets amount information by user.
- **Upload Packets：** Display total upload packets amount information by user.
- **Download Bytes：** Display total download flow information by user.
- **Upload Bytes：** Display total upload flow information by user.

8.4 Authentication Log by Captive Portal



Notice — Display online users status only in Access point mode

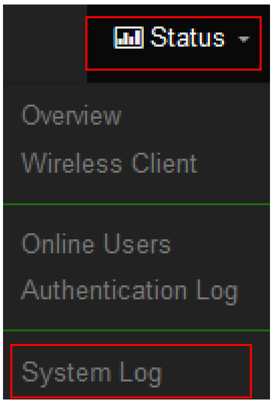
The authentication log can monitor account login/logout type and account use time.



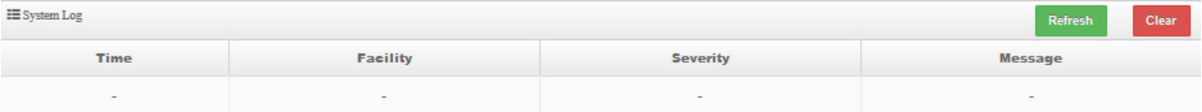
Authentication Zone Log

#	Date/Time	Status	User	IP Address	MAC Address	Download Packets	Upload Packets	Download Bytes	Upload Bytes
1	2016/01/01 00:01:53	LOGIN	test	192.168.2.22	[redacted]7	0	0	0B	0B
2	2016/01/01 00:26:12	LOGOUT	test	192.168.2.22	[redacted]7	1028	890	761.08KB	107.40KB
3	2016/01/01 00:26:12	LOGIN	test	192.168.2.23	[redacted]9:50	0	0	0B	0B

8.5 系統紀錄



The system log displays system events when system is up and running. Also, it becomes very useful as a troubleshooting tool when issues are experienced in system.



System Log

Time	Facility	Severity	Message
-	-	-	-

- **Time**：The date and time when the event occurred.
- **Facility**：It helps users to identify source of events such “System” or “User”
- **Severity**：Severity level that a specific event is associated such as “info”, “error”, “warning”, etc.
- **Message**：Description of the event.
- Click **“Refresh”** button to renew the log
- Click “**Clear”** button to clear all the record.

Appendix A. WEB GUI Valid Characters

Table B   WEB GUI Valid Characters

Block	**Field**	**Valid Characters**
LAN	IP Address	IP Format; 1-254
	IP Netmask	128.0.0.0 ~ 255.255.255.252
