

# CERIO Corporation

## CS-34816XG

**16 Port SFP Gigabit + 8 Combo Gigabit Ports Managed L2/L3  
Lite Fiber Optical Switch with 4 SFP+ 10Gigabit Ports**

### User Manual

#### Default IP / Login Information

IP Address	192.168.2.200
User Name	root
Password	default

## **FCC Warning**

This device has been tested and found to comply with limits for a Class A digital device, pursuant to Part 2 and 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses and can radiates radio frequency energy and, if not installed and used in accordance with the user's manual, may cause interference in which case user will be required to correct the interference at his own expense.

## **CE Mark Warning**

This is a Class A product. In a domestic environment, this product may cause radio interference in which case the user may be required to take adequate measures.

## 1. Exterior

### 1.1 Front Panel

### 1.2 Rear Panel Layout

**Status LED lights for 24 SFP Gigabit Ports (16 SFP Ports + 8 Combo Ports) with 4 SFP+ 10Gigabit Ports**

**Per Port :** Link/Activity Status

**Per Port :** Speed Status

**Per Unit :** SYS

**Per Unit :** PWR

- 1) AC Power On/Off Control Switch
- 2) AC input (100-240V/AC, 50-60Hz) UL Safety
- 3) Ground screw lock point

## 2. Software Configuration

**CS-34816XG** supports web-based configuration. Upon the completion of hardware installation, The Switch can be configured through a PC/NB by using its web browser such as Internet Explorer 6.0 or later.

Set the IP segment of the administrator's computer to be in the same range as **CS-34816XG** for accessing the system. Do not duplicate the IP Address used here with IP Address of **CS-34816XG** or any other device within the network. *Please refer to the following steps*

### 2.1 Example of Segment: (Windows OS)

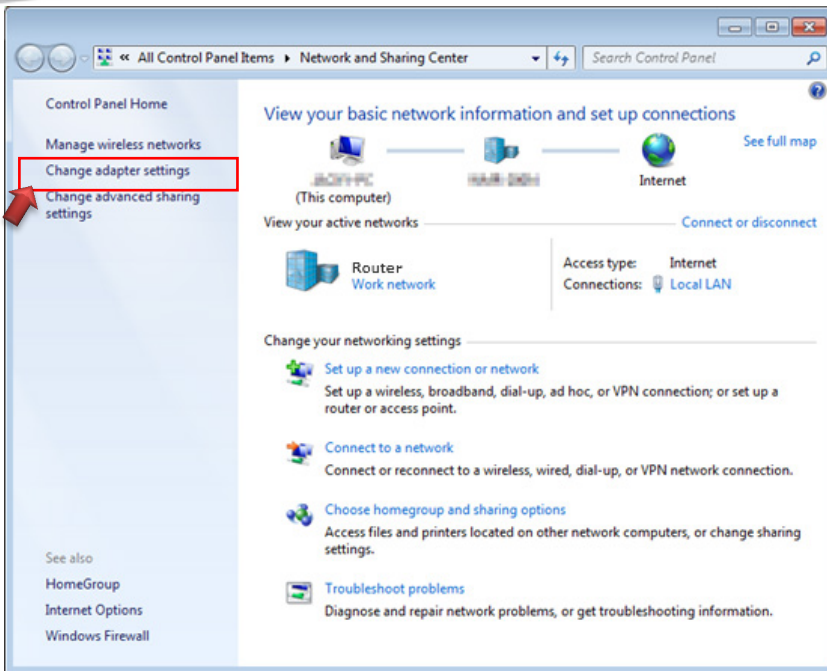

#### Step 1 :

Please click on the computer icon in the bottom right window, and click “**Open Network and Sharing Center**”

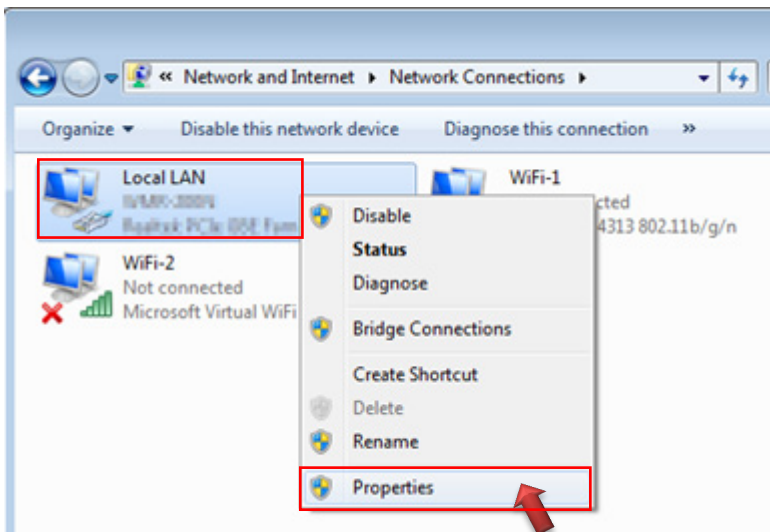

#### Step 2 :

In the Network and Sharing Center page, click on the left side of “**Change adapter setting**” button

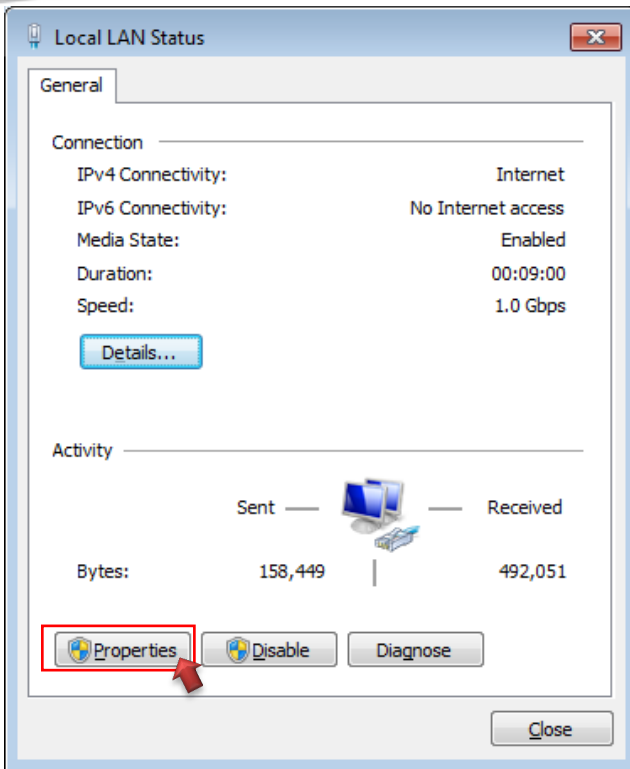

### Step 3 :

In “Change adapter setting” Page, right click on Local LAN then select “Properties”

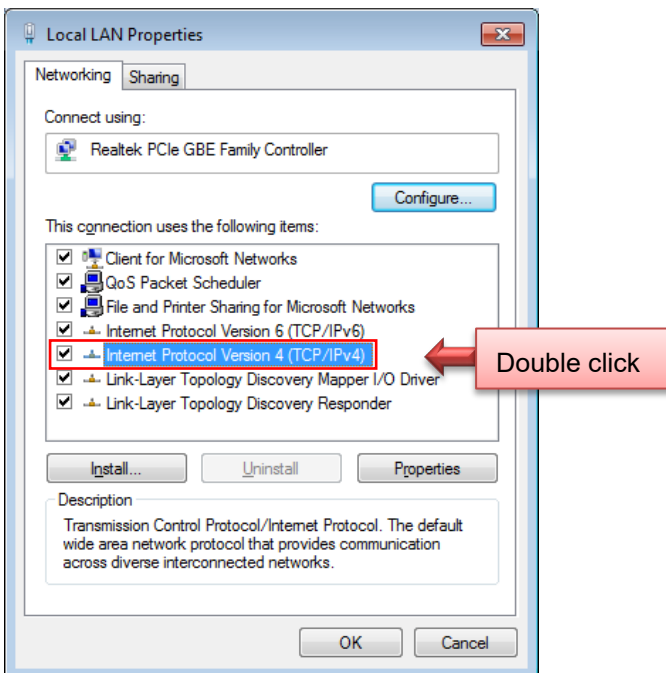

### Step 4 :

In the “Properties” page, click the “Properties” button to open TCP/IP setting

### Step 5 :

In Properties page for setting IP addresses, find **“Internet Protocol Version 4 (TCP/IPv4)”** and double click to open TCP/IPv4 Properties window

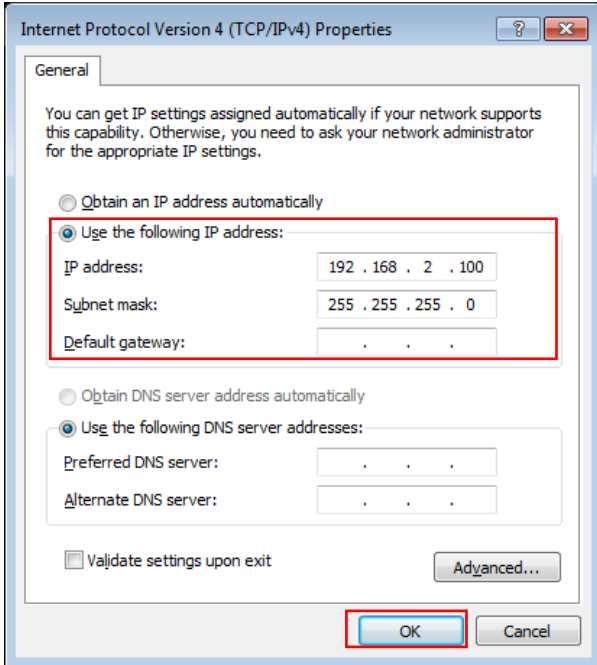

### Step 6 :

Select **“Use the following IP address”**, and fix in IP Address to: 192.168.2.X

ex. The X is any number from 1 to 253

Subnet mask : 255.255.255.0

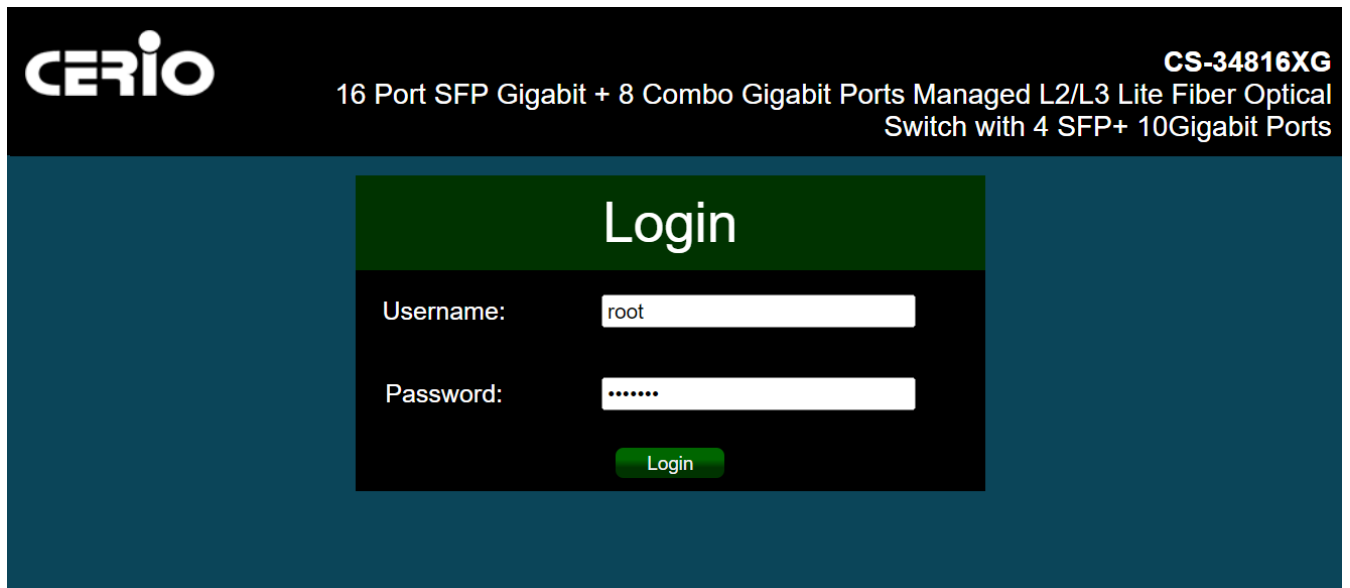

And Click "OK" to complete fixing the computer IP settings

**Step 7 :**

**Open Web Browser**

Without a valid certificate, users may encounter the following problem in IE7 when they try to access system's WMI (<http://192.168.2.200>). There will be a "Certificate Error", because the browser treats system as an illegal website.

System login Overview page will appear after successful login.

## 2.2 System login information and IP / Gateway Setting instructions

The **CS-34816XG** web switch default IP is 192.168.2.200

Into the management page as follows, please enter Username and password

- **Default IP Address:** 192.168.2.200
- **Default Username and Password**

<b>Management Account</b>	Root Account
<b>Username</b>	root
<b>Password</b>	default

After the authentication procedure, the home page will show up. Select one of the configurations by clicking the icon.

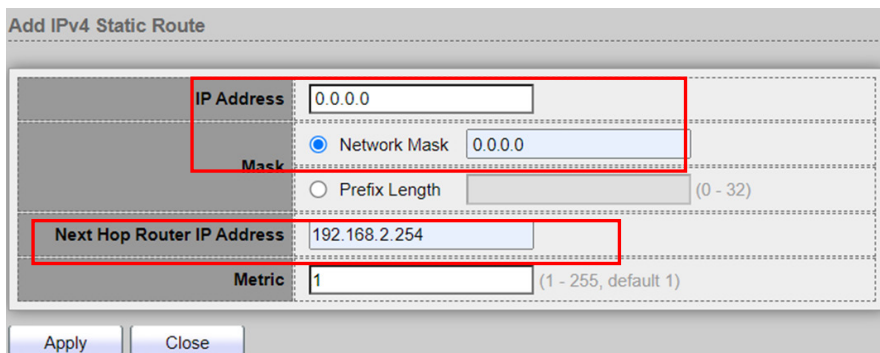

### Default IP Configure:

**Edit IPv4 Interface**

<b>Interface</b>	VLAN 1
<b>Address Type</b>	<input type="radio"/> Dynamic <input checked="" type="radio"/> <b>Static</b>
<b>IP Address</b>	<input type="text" value="192.168.2.200"/>
<b>Mask</b>	<input checked="" type="radio"/> <b>Network Mask</b> <input type="text" value="255.255.255.0"/> <input type="radio"/> Prefix Length <input type="text" value=""/> (8 - 30)
<b>Roles</b>	<input checked="" type="radio"/> primary <input type="radio"/> sub

**Note** If you want to change the default IP ( VLAN IP ) address of the Fiber Optical Switch, please refer to the chapter : 13.1.1. for " IP Configuration > IPv4 Interface & Default IP Configure >" ( Please refer to page 147 )

**Layer 3 Default Route Configure: (This function is the same as the "Default Gateway Configure " of the Layer 2 switch)**

**Add IPv4 Static Route**

<b>IP Address</b>	0.0.0.0
<b>Mask</b>	<input checked="" type="radio"/> Network Mask 0.0.0.0 <input type="radio"/> Prefix Length (0 - 32)
<b>Next Hop Router IP Address</b>	192.168.2.254
<b>Metric</b>	1 (1 - 255, default 1)

Apply Close

**Note** If you want to make default Route IP address of the L3 Fiber Optical Switch, please refer to the chapter : 13.1.2. for " IP Configuration > IPv4 Routes & Default Route Configure >" ( Please refer to page 151 )

## 3. Status

### 3.1 System Information

Administrator can check this page shows switch panel, CPU utilization, Memory utilization and other system current information. It also allows user to edit some system information.

**Note** In the Web UI, the left column shows the configuration menu. The top row shows the switch’s current link status. Green squares indicate the port link is up, while black squares indicate the port link is down. Below the switch panel, you can find a common toolbar to provide useful functions for users. The rest of the screen area displays the configuration settings.

The screenshot displays the 'System Information' page in the CERIO web UI. On the left is a navigation menu with categories like Status, Network, Port, VLAN, etc. The main content area shows a switch panel with 28 ports (1-28) and their link status (green for up, black for down). Below the switch panel is a 'System Information' table with an 'Edit' button. To the right are two line graphs: 'CPU' utilization (0-100%) and 'MEM' (Memory) utilization (0-100%), both showing low usage over time.

System Information	
Model	CS-34816XG
System Name	Switch
System Location	default
System Contact	default
MAC Address	8C:4D:EA:02:D8:64
IPv4 Address	192.168.101.97
System Uptime	0 day, 5 hr, 43 min and 13 sec
Current Time	2024-02-21 00:12:13 UTC+8
Loader Version	3.6.7.55090
Loader Date	Feb 19 2024 - 06:29:32
Firmware Version	1.0.0.25
Firmware Date	Feb 19 2024 - 06:29:49
Telnet	Disabled
SSH	Disabled
HTTP	Enabled
HTTPS	Disabled
SNMP	Disabled

Field	Description
Model	Model name of the switch.
System Name	System name of the switch. This name will also use as CLI prefix of each line. ("Switch>" or "Switch#")

<b>System Location</b>	Location information of the switch.
<b>System Contact</b>	Contact information of the switch.
<b>MAC Address</b>	Base MAC address of the switch.
<b>IPv4 Address</b>	Current system IPv4 address.
<b>IPv6 Address</b>	Current system IPv6 address.
<b>System OID</b>	SNMP system object ID.
<b>System Uptime</b>	Total elapsed time from booting.
<b>Current Time</b>	Current system time.
<b>Loader Version</b>	Boot loader image version.
<b>Loader Date</b>	Boot loader image build date.
<b>Firmware Version</b>	Current running firmware image version.
<b>Firmware Date</b>	Current running firmware image build date.
<b>Telnet</b>	Current Telnet service enable/disable state.
<b>SSH</b>	Current SSH service enable/disable state.
<b>HTTP</b>	Current HTTP service enable/disable state.
<b>HTTPS</b>	Current HTTPS service enable/disable state.
<b>SNMP</b>	Current SNMP service enable/disable state.

## Edit System Information

Administrator can click “Edit” button on the table title to edit following system information.

### Edit System Information

<b>System Name</b>	<input type="text" value="Switch"/>
<b>System Location</b>	<input type="text" value="default"/>
<b>System Contact</b>	<input type="text" value="default"/>

- **System Name:** System name of the switch. This name will also use as CLI prefix of each line. ("Switch>" or "Switch#").
- **System Location:** Location information of the switch.
- **System Contact:** Contact information of the switch.

Click the **"Apply"** button to save your changes or **"Close"** the button to close settings.

## 3.2 Logging Message

Administrator can use this tools page to Inspection of system RAM and Flash status.

Status → **Logging Message**

- Status
- System Information
- Logging Message
- Port
- Link Aggregation
- MAC Address Table
- Network
- Port
- VLAN
- MAC Address Table
- Spanning Tree
- ERPS

- Management

### Logging Message Table

Viewing RAM

Showing All entries Showing 1 to 5 of 5 entries

Log ID	Time	Severity	Description
1	Feb 21 2024 00:12:10	notice	AAA-0-CONNECT: New http connection for user root, source 36.229.95.235 ACCEPTED
2	Feb 20 2024 23:43:13	notice	AAA-5-CONNECT: New http connection for user root, source 192.168.101.63 ACCEPTED
3	Jan 01 2024 08:00:11	notice	PORT-5-LINK_UP: Interface VLAN1 link up
4	Jan 01 2024 08:00:11	notice	PORT-5-LINK_UP: Interface GigabitEthernet3 link up
5	Jan 01 2024 00:00:09	notice	SYSTEM-5-COLDSTART: Cold startup

First Previous 1

- **Viewing:** The logging view including:
  - **RAM:** Show the logging messages stored on the RAM.

- **Flash:** Show the logging messages stored on the Flash.

Field	Description
Log ID	The log identifier.
Time	The time stamp for the logging message.
Severity	The severity for the logging message.
Description	The description of logging message.

Click the **“Clear”** button to clear this page or click the **“Refresh”** button to refresh the page .

## 3.3 Port

Display detailed port summary and status information for each port.

### 3.3.1 Statistics

Administration can choose to view displays standard counters on network traffic form the Interfaces, Ethernet-like and RMON MIB. Interfaces and Ethernet-like counters display errors on the traffic passing through each port. RMON counters provide a total count of different frame types and sizes passing through each port. The **“Clear”** button will clear MIB counter of current selected port.

- **Port** : Select one port to show counter statistics.
- **MIB Counter** : Select the MIB counter to show different counter type.
  - **All** : All counters.
  - **Interface** : Interface related MIB counters.
  - **Etherlike** : Ethernet-like related MIB counters.
  - **RMON** : RMON related MIB counters.
- **Refresh Rate** : Refresh the web page every period of “None , 5 sec , 10 sec , 30 sec “seconds base to get new counter of specified port.

### 3.3.2 Error Disabled

If administrator has set Error disabled functions then can monitor information in page.

**Status → Port → Error Disabled**

**– Status**

- System Information
- Logging Message
- Port
- Statistics
- Error Disabled**
- Bandwidth Utilization
- Link Aggregation
- MAC Address Table
- Network
- Port
- VLAN
- MAC Address Table
- Spanning Tree

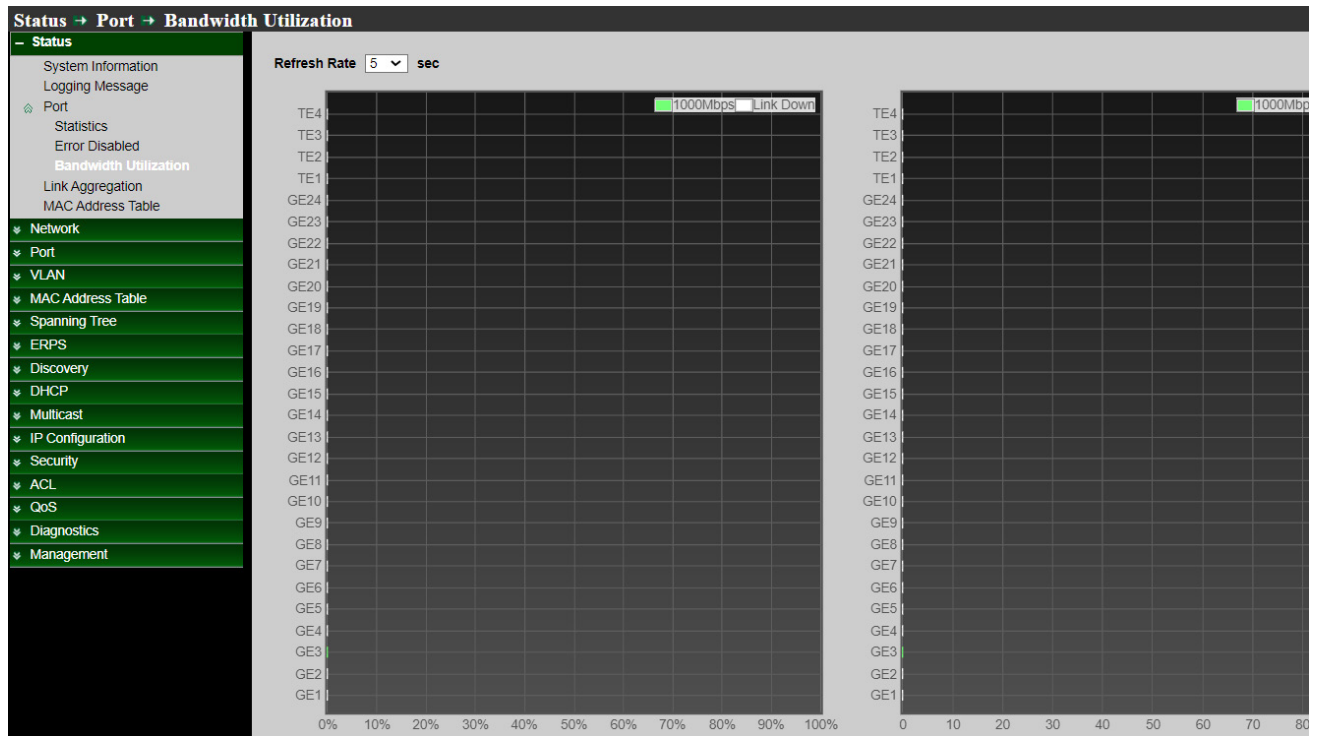

**Error Disabled Table**

<input type="checkbox"/>	Port	Reason	Time Left (sec)
<input checked="" type="checkbox"/>	GE1	---	---
<input checked="" type="checkbox"/>	GE2	---	---
<input type="checkbox"/>	GE3	---	---
<input type="checkbox"/>	GE4	---	---
<input type="checkbox"/>	GE5	---	---
<input type="checkbox"/>	GE6	---	---
<input checked="" type="checkbox"/>	GE7	---	---

Field	Description
<b>Port</b>	Interface or port number.
<b>Reason</b>	<p>Port will be disabled by one of the following error reason:</p> <ul style="list-style-type: none"> <li>BPDU Guard.</li> <li>UDLD.</li> <li>Self Loop.</li> <li>Broadcast Flood.</li> <li>Unknown Multicast Flood.</li> <li>Unicast Flood.</li> <li>ACL.</li> <li>Port Security Violation.</li> <li>DHCP rate limit.</li> <li>ARP rate limit.</li> </ul>
<b>Time Left (sec)</b>	The time left in second for the error recovery.

### 3.3.3 Bandwidth Utilization

This page can display Tx / Rx Real-time bandwidth information of each port. (Instant used rate per port and this page will refresh automatically in every refresh period)

- **Refresh Rate:** Refresh the web page every period of seconds to get new bandwidth utilization data.
  - **2** : Select the 2 second cycle from the drop-down menu to refresh the display page.
  - **5** : Select the 5 second cycle from the drop-down menu to refresh the display page.
  - 10** : Select the 10 second cycle from the drop-down menu to refresh the display page.

### 3.4 Link Aggregation

If administrator has set LACP function then this can display LACP information. This system have support 8 Link Aggregation group. Administrator can enable 8 LAG.

**Status → Link Aggregation**

- Status
  - System Information
  - Logging Message
  - Port
  - Statistics
  - Error Disabled
  - Bandwidth Utilization

LAG 3		---	---		
LAG 4		---	---		
LAG 5		---	---		
LAG 6		---	---		
LAG 7		---	---		
LAG 8		---	---		

Field	Description
<b>LAG</b>	LAG Name.
<b>Name</b>	LAG port description.
<b>Type</b>	The type of the LAG. <ul style="list-style-type: none"> <li><b>Static:</b> The group of ports assigned to a static LAG are always active members.</li> <li><b>LACP:</b> The group of ports assigned to dynamic LAG are candidate ports. LACP determines which candidate ports are active member ports.</li> </ul>
<b>Link Status</b>	LAG port link status.
<b>Active Member</b>	Active member ports of the LAG.
<b>Inactive Member</b>	Inactive member ports of the LAG.

### 3.5 MAC Address Table

The MAC address table page displays all MAC address entries on the switch including static MAC address created by administrator or auto learned from hardware.

The **“Clear”** button will clear all dynamic entries and **“Refresh”** button will retrieve latest MAC address entries and show them on page.

**Status → MAC Address Table**

1	F4:6D:2F:96:CC:7F	Dynamic	GE3

Field	Description
<b>VLAN</b>	VLAN ID of the mac address
<b>MAC Address</b>	MAC address
<b>Type</b>	The type of MAC address <ul style="list-style-type: none"> <li><b>Management:</b> DUT's base mac address for management purpose</li> <li><b>Static:</b> Manually configured by administrator</li> <li><b>Dynamic:</b> Auto learned by hardware</li> </ul>
<b>Port</b>	The type of Port <ul style="list-style-type: none"> <li><b>CPU:</b> DUT's CPU port for management purpose</li> <li><b>Other:</b> Normal switch port</li> </ul>

Click the **“Clear”** button to clear this page or click the **“Refresh”** button to refresh the page .

## 4. Network

### 4.1 DNS

DNS (Domain Name System) is for mapping a domain name to its corresponding IP address and vice versa. Use the DNS screen to configure and view the default DNS servers on the Switch.

Use these pages to configure information about which DNS servers your network uses and how the switch operates as a DNS client.

DNS service on this switch allows host names to be mapped to IP addresses using static table entries or by redirection to other name servers on the network. When a client device designates this switch as a DNS server, the client will attempt to resolve host names into IP addresses by forwarding DNS queries to the switch, and waiting for a response.

You can manually configure entries in the DNS table used for mapping domain names to IP addresses, configure default domain names, or specify one or more name servers to use for domain name to address translation.

You can use these pages to configure information about DNS servers the network uses and how the switch operates as a DNS client.

Use this page to configure global DNS settings and DNS server information.

**Network → DNS**

- Status

**DNS Server Configuration**

Preference	DNS Server
<input type="checkbox"/> 1	192.168.102.200

Add Delete

#### DNS Configuration

Select the Disable or Enable button to specify whether to disable or enable the administrative state of the DNS client:

- **DNS Status:**
  - **Disable** : Prevent the switch from sending DNS queries.
  - **Enable** : Allow the switch to send DNS queries to a DNS server to resolve a DNS domain name.
- **DNS Default Name** : Enter the default DNS domain name to include in DNS queries.

**Note** When the system is performing a lookup on an unqualified host name, this field is provides the domain name (for example, if default domain name is cerio.cc and the user enters oem, then "oem" is changed to oem.cerio.cc to resolve the name). The name must not be longer than 255 alphanumeric characters.

Click the **“Apply”** button to save your changes.

## DNS Server Configuration

Administrator can configure this DNS Server Setting **“add”** and **“Delete”** function management.

Field	Description
Preference	The Preference field displays the server preference order. The preference is set in the order in which preferences were entered.
DNS Server	Shows the server is added to the list.

**Note** The **“preference”** of the DNS server. The preferences are determined by the order in which they were entered. You can specify up to eight DNS servers.

- **Add** : To specify the DNS server to which the switch sends DNS queries, enter an IP address in standard IPv4 dot notation in the DNS Server Address and click Add. The server appears in the list below. You can specify up to eight DNS servers. The preference is set in the order created.
- **Delete** : To remove a DNS server from the list, select the check box next to the server you want to remove and click Delete. If no DNS server is specified, the check box is global and will delete all the DNS servers listed.

Administrator can configure this DNS Server Configuration “Apply” and “Cancel” on the screen and reset the data on the screen to the latest value of the switch.

## 4.2 Host

This page provide administrator to view Host Name to IP Address Information, Administrator can set this page to manually map host names to IP addresses or to view dynamic host mappings.

Click the “Clear” button to clear this page

### DNS Host Configuration

Administrator can configure “add” and “Delete” for a static entry to the local dynamic host mapping Table function management.

Field	Description
Host	Show “host name” that for you assign to the specified IP address.
IPv4/IPv6 Address	The IP address associated with the “host name”.

**Add Host**

---

<b>Host</b>	<input style="width: 80%;" type="text" value="google.com"/> <small>(1 to 255 alphanumeric characters)</small>
<b>IPv4/IPv6 Address</b>	<input style="width: 80%;" type="text" value="216.239.32.10"/>

- **Host:** Administrator can set the Host Name field, specify the static host name to add.
- **IPv4/IPv6 Address:** Enter the IP address to associate with the host name to this " IPv4/IPv6 Address" field, The entry is displayed in the list on the page after **"Apply"** creation.

**Note** For Host Name field, Must be follow 1 to 255 alphanumeric characters, Its length cannot exceed 158 characters and it is a required field.

Click the **"Apply"** button to save your changes or **"Close"** the button to close settings.

### Dynamic Host Mapping

Administrator can clear all the dynamic host name entries from the list, click the Clear button.

The Dynamic Host Mapping table shows host name-to-IP address entries that the switch learned.

Field	Description
<b>Host</b>	Displays the lists the host name you assign to the specified IP address.
<b>Total</b>	Displays the amount of time since the dynamic entry was first added to the table.
<b>Elapsed</b>	Displays the amount of time since the dynamic entry was last updated.
<b>Type</b>	Displays the type of the dynamic entry.
<b>IPv4/IPv6 Address</b>	Displays the lists the IPv4 or IPv6 addresses associated with the host name.

Click the **"Apply"** button to save your changes or click the **"Clear"** button to refresh the page .

## 4.3 System Time

System time can be configured via this page. Administrator can select SNTP Server or from computer to update the system time or administration can use manual setting the system time.

Note. If administrator chooses SNTP Server to synchronization update time then must confirm system gateway and DNS is correct and switch system must be able to connect to the SNTP Server.

  - **Auto:** Auto flow control by negotiation
  - **Enabled:** Enable flow control ability
  - **Disabled:** Disable flow control ability

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 5.2 Error Disabled

This function can block of faulty operation, including EPDU Guard / UDLD / Self Loop / Broadcast Flood / Unknown Multicast Flood / Unicast Flood / ACL / Port Security / DHCP Rate Limit / ARP Rate Limit etc.

After administrator enable this functions, if occur error in table functions then system will auto immediate block of faulty operation until the after the set time, system will auto re-enable.

<b>Recovery Interval</b>	<input type="text" value="300"/>	Sec (30 - 86400)
<b>BPDU Guard</b>	<input checked="" type="checkbox"/>	Enable
<b>UDLD</b>	<input checked="" type="checkbox"/>	Enable
<b>Self Loop</b>	<input checked="" type="checkbox"/>	Enable
<b>Broadcast Flood</b>	<input checked="" type="checkbox"/>	Enable
<b>Unknown Multicast Flood</b>	<input checked="" type="checkbox"/>	Enable
<b>Unicast Flood</b>	<input checked="" type="checkbox"/>	Enable
<b>ACL</b>	<input checked="" type="checkbox"/>	Enable
<b>Port Security</b>	<input checked="" type="checkbox"/>	Enable
<b>DHCP Rate Limit</b>	<input checked="" type="checkbox"/>	Enable
<b>ARP Rate Limit</b>	<input checked="" type="checkbox"/>	Enable

- **Recovery Interval:** Auto recovery after this interval for error disabled port.
- **BPDU Guard:** Enabled to auto shutdown port when BPDU Guard reason occur.  
\*This reason caused by STP BPDU Guard mechanism.
- **UDLD:** Enabled to auto shutdown port when UDLD violation occur.

- **Self Loop:** Enabled to auto shutdown port when Self Loop reason occur.
- **Broadcast Flood:** Enabled to auto shutdown port when Broadcast Flood reason occur.  
\*This reason caused by broadcast rate exceed broadcast storm control rate.
- **Unknown Multicast Flood:** Enabled to auto shutdown port when Unknown Multicast Flood reason occur. This reason caused by unknown multicast rate exceed unknown multicast storm control rate.
- **Unicast Flood:** Enabled to auto shutdown port when Unicast Flood reason occur.  
\*This reason caused by unicast rate exceed unicast storm control rate.
- **ACL:** Enabled to auto shutdown port when ACL shutdown port reason occur.  
\* This reason caused packet match the ACL shutdown port action.
- **Port Security:** Enabled to auto shutdown port when Port Security Violation reason occur.  
\*This reason caused by violation port security rules.
- **DHCP rate limit:** Enabled to auto shutdown port when DHCP rate limit reason occur.  
\*This reason caused by DHCP packet rate exceed DHCP rate limit.
- **ARP rate limit:** Enabled to auto shutdown port when ARP rate limit reason occur.  
\*This reason caused by DHCP packet rate exceed ARP rate limit.

Click the **“Apply”** button to save your changes settings.

## 5.3 Link Aggregation

Link Aggregation is also referred to as link aggregation, teaming port, and port trunk for 802.3ad (LACP, Link Aggregation Control Protocol), The Port Aggregation can aggregate multiple Ethernet ports together to form a logical aggregation group. To upper layer entities, all the physical links in an aggregation group are a single logical link.

### 5.3.1 Group Configuration

Administrator can select use MAC Address or IP-MAC address of load balance Algorithm.

This system default can set 8 LA group, administrator can select LAG number and click Edit button go to set LA used ports.

**Port → Link Aggregation → Group**

- **Flow Control:** Port flow control.
  - **Auto:** Auto flow control by negotiation
  - **Enabled:** Enable flow control ability
  - **Disabled:** Disable flow control ability

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 5.3.3 LACP

The LACP can aggregate multiple Ethernet ports together to form a logical aggregation group. To upper layer entities, all the physical links in an aggregation group are a single logical link. Administrator can to configure LACP global and port configurations. Select ports and click “Edit” button to edit port configuration.

<input type="checkbox"/>	Entry	Port	Port Priority	Timeout
<input type="checkbox"/>	1	GE1	1	Short
<input type="checkbox"/>	2	GE2	1	Long
<input type="checkbox"/>	3	GE3	1	Long
<input type="checkbox"/>	4	GE4	1	Long
<input type="checkbox"/>	5	GE5	1	Long
<input type="checkbox"/>	6	GE6	1	Long
<input type="checkbox"/>	7	GE7	1	Long

- **System Priority:** Administrator configures the LACP system priority on each switch running LACP. LACP uses the system priority with the switch MAC address to form the system ID and also during negotiation with other switches. This decides the system priority field in LACP PDU.

*Click the “Apply” button to save your changes settings.*

**Note** The function with the lower system priority value determines which links between LACP partner devices are active and which are in standby for each LACP group. The device on the controlling end of the link uses port priorities to determine which ports are bundled into the aggregated bundle and which ports are put in standby mode. Port priorities on the other device (the non-controlling end of the link) are ignored. In priority comparisons, numerically lower values have higher priority. Therefore, the system with the numerically lower value (higher priority value) for LACP system priority becomes the controlling system. If both devices have the same LACP system priority (for example, they are both configured with the default setting of 32768), the device MAC address determines which switch is in control.

Field	Description
Port	Port Name.
Port Priority	LACP priority value of the port.
Timeout	The periodic transmissions type of LACP PDUs.
	<ul style="list-style-type: none"> <li>• <b>Long:</b> Transmit LACP PDU with slow periodic (30s).</li> <li>• <b>Short:</b> Transmit LACPP DU with fast periodic (1s).</li> </ul>

- **Port:** Selected port list.
- **Port Priority:** Enter the LACP priority value of the port.
- **Timeout:** The periodic transmissions type of LACP PDUs.
  - **Long:** Transmit LACP PDU with slow periodic (30s).
  - **Short:** Transmit LACPP DU with fast periodic (1s).

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 5.4 EEE

Energy Efficient Ethernet (EEE) combines the MAC with a family of physical layers that support operation in a low power mode. It is defined by IEEE 802.3az Energy Efficient Task Force. Lower power mode enables both the send and receive sides of the link to disable some functionality for power savings when lightly loaded. Transition to low power mode does not change the link status. Frames in transit are not dropped or corrupted in transition to and from low power mode. Transition time is transparent to upper layer protocols and applications.

This switch support Energy-efficient Ethernet(EEE) function. Administrator can by ports to setting Enable or Disable for the EEE function. The default is “Disable”.

<input type="checkbox"/>	Entry	Port	State
<input checked="" type="checkbox"/>	1	GE1	Enabled
<input type="checkbox"/>	2	GE2	Disabled
<input checked="" type="checkbox"/>	3	GE3	Enabled

Field	Description
Port	Port Name
State/Operational Status	Port EEE admin state. <ul style="list-style-type: none"> <li><b>Enabled:</b> EEE is enabled/ is operating</li> <li><b>Disabled:</b> EEE is disabled/ is no operating</li> </ul>

### Edit EEE Setting

<b>Port</b>	GE3,GE7,GE9,GE12-GE13
<b>State</b>	<input checked="" type="checkbox"/> Enable

- **Port:** Selected port list.
- **State:** Port EEE admin state.
  - **Enable:** Enable EEE
  - **Disable:** Disable EEE

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 5.5 Jumbo Frame

The administrator can set the Jumbo Frame size and display it on this page.

Port → Jumbo Frame

- ✖ Status
- ✖ Network
- Port
  - Port Setting
  - Error Disabled
  - 📍 Link Aggregation
    - Group
    - Port Setting
    - LACP
  - EEE
  - Jumbo Frame

Jumbo Frame
 Enable

Byte (1518 - 10000, default 1522)

- **Jumbo Frame:** Enable or disable jumbo frame. When jumbo frame is enabled, switch max frame size is allowed to configure. When jumbo frame is disabled, default frame size 1522 will be used.

<b>Note</b>	When jumbo frames are required, the maximum frame size (10000) of the switch is allowed to be configured. Uncheck to apply : When you click uncheck to <b>“Apply”</b> , The switch will back to default regular frame size "1522".
-------------	--

Click the **“Apply”** button to save your changes settings.

## 6. VLAN

A virtual local area network, virtual LAN or VLAN, is a group of hosts with a common set of requirements that communicate as if they were attached to the same broadcast domain, regardless of their physical location. A VLAN has the same attributes as a physical local area network (LAN), but it allows for end stations to be grouped together even if they are not located on the same network switch.

The **CS-34816XG** adding Virtual LAN (VLAN) support to a Layer 2 switch offers some of the benefits of both bridging and routing. Like a bridge, a VLAN switch forwards traffic based on the Layer 2 header, which is fast, and like a router, it partitions the network into logical segments, which provides better administration, security and management of multicast traffic.

Administrator can set IEEE 802.1q Tag Based VLAN or Port Based VLAN. System default is VLAN1 Port based (PVID).

### 6.1 VLAN

#### 6.1.1 Create VLAN

Administrator can select VLAN number in Available VLAN list, this VLAN number based on IEEE 802.1q standard. Available VLAN list can be multiple choices.

**VLAN → VLAN → Create VLAN**

11	GE11	Trunk	<input checked="" type="radio"/> Excluded	<input type="radio"/> Tagged	<input type="radio"/> Untagged	<input type="checkbox"/>	<input type="checkbox"/>

Field	Description
<b>VLAN</b>	Select specified VLAN ID to configure VLAN configuration.
<b>Port</b>	Display the interface of port entry.
<b>Mode</b>	Display the interface VLAN mode of port.
<b>Membership</b>	Select the membership for this port of the specified VLAN ID. <ul style="list-style-type: none"> <li>• <b>Forbidden:</b> Specify the port is forbidden in the VLAN.</li> <li>• <b>Excluded:</b> Specify the port is excluded in the VLAN.</li> <li>• <b>Tagged:</b> Specify the port is tagged member in the VLAN.</li> <li>• <b>Untagged:</b> Specify the port is untagged member in the VLAN.</li> </ul>
<b>PVID</b>	Display if it is PVID of interface.
<b>Forbidden</b>	<b>Forbidden:</b> Specify the port is forbidden in the VLAN.

- **VLAN:** Administrator can click drop down menu to choose VLAN and set.
  - **Excluded:** This interface is currently not a member of the VLAN. This is the default for all the ports and LAGs.
  - **Tagged:** This interface is a tagged member of the VLAN.

- **Untagged:** This interface is an untagged member of the VLAN. Frames of the VLAN are sent untagged to the interface VLAN.
- **PVID:** Check to set the PVID of the interface to the VID of the VLAN. PVID is a per-port setting.
- **Forbidden:** Select for this specified port of the Forbidden.

### 6.1.3 Membership

Display all port setting information. Administrator can checkbox and click “Edit” button to modify VLAN type. *(Note: Number=VLAN number, F=Forbidden, T=Tagged, U=Untagged, P=PVID)*

When a port is forbidden default VLAN membership, that port is not allowed membership in any other VLAN. An internal VID of 4095 is assigned to the port. This PVID on the ports between the two devices must be the same if the ports are to send and receive untagged packets to and from the VLAN. Otherwise, traffic might leak from one VLAN to another.

<input checked="" type="checkbox"/>	9	GE9	Hybrid	1	Tag Only	Disabled	Disabled	0x8100
<input checked="" type="checkbox"/>	10	GE10	Hybrid	1	Tag Only	Disabled	Disabled	0x8100
<input type="checkbox"/>	11	GE11	Trunk	1	All	Enabled	Disabled	0x8100

Field	Description
<b>Port</b>	Display the interface.
<b>Mode</b>	Display the VLAN mode for Hybrid/Access/Trunk/Tunnel mode of port.
<b>PVID</b>	Display the Port-based VLAN ID of port.
<b>Accept Frame Type</b>	Display accept frame type of port.
<b>Ingress Filtering</b>	Display ingress filter status of port.
<b>Uplink</b>	Display uplink status.
<b>TPID</b>	Display TPID used of interface.

**Edit Port Setting**

<b>Port</b>	GE4-GE10
<b>Mode</b>	<input checked="" type="radio"/> Hybrid <input type="radio"/> Access <input type="radio"/> Trunk <input type="radio"/> Tunnel
<b>PVID</b>	<input type="text" value="1"/> (1 - 4094)
<b>Accept Frame Type</b>	<input type="radio"/> All <input checked="" type="radio"/> Tag Only <input type="radio"/> Untag Only
<b>Ingress Filtering</b>	<input type="checkbox"/> Enable
<b>Uplink</b>	<input type="checkbox"/> Enable
<b>TPID</b>	0x8100 ▾

- **Hybrid:** The interface can be a tagged or untagged member of one or more VLANs.
- **Access:** The interface is an untagged member of a single VLAN. A port configured in this mode is known as an access port.
- **Trunk:** The interface is an untagged member of one VLAN at most, and is a tagged member of zero or more VLANs. A port configured in this mode is known as a trunk port.
- **Tunnel:** This enables the user to use own VLAN arrangements (PVID) across the provider network.
- **PVID:** Enter the Port VLAN ID (PVID) of the VLAN to which incoming untagged and priority tagged frames are classified.
- **Accept Frame Type:** Select the type of frame that the interface can receive. Frames that are not of the configured frame type are discarded at ingress. These frame types are only available in General mode. As follow.
  - **All:** The interface accepts all types of frames: untagged frames, tagged frames, and priority tagged frames.
  - **Tag Only:** The interface accepts only tagged frames.
  - **Untag Only:** The interface accepts only untagged and priority frames.
- **Ingress Filtering:** Administrator can check **Enable** to enable ingress filtering. When an interface is ingress filtering enabled, the interface discards all incoming frames that are classified as VLANs of which the interface is not a member. Ingress filtering can be disabled or enabled on general ports. It is always enabled on access ports and trunk ports.
- **Uplink:** Administrator can check **Enable** to set the interface as an uplink port.
- **TPID:** If Uplink is enabled, select the Modified Tag Protocol Identifier (TPID) value for the interface.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 6.2 Voice VLAN

Voice VLAN allows you to enhance VoIP service by configuring ports to carry IP Voice traffic from IP phones on a specific VLAN. VoIP traffic has a preconfigured OUI prefix in the source MAC address. Administrator can set VLAN ID in the range of 1 to 4094.

### 6.2.1 Property

**VLAN → Voice VLAN → Property**

State Enable  
 VLAN: VLAN4094  
 CoS / 802.1p Remarking: 5  
 Aging Time: 1440 (Min (30 - 65536, default 1440))

**Port Setting Table**

Entry	Port	State	Mode	QoS Policy
<input type="checkbox"/>	1 GE1	Disabled	Auto	Voice Packet
<input type="checkbox"/>	2 GE2	Disabled	Auto	Voice Packet
<input type="checkbox"/>	3 GE3	Disabled	Auto	Voice Packet
<input type="checkbox"/>	4 GE4	Disabled	Auto	Voice Packet
<input type="checkbox"/>	5 GE5	Disabled	Auto	Voice Packet

Click the **“Apply”** button to save your changes settings.

Field	Description
Port	Display port entry.
State	Display enable/disabled status of interface.
Mode	Display voice VLAN mode.
QoS Policy	Display voice VLAN remark will effect which kind of packet.

**Edit Port Setting**

<b>Port</b>	GE1
<b>State</b>	<input type="checkbox"/> Enable
<b>Mode</b>	<input checked="" type="radio"/> Auto <input type="radio"/> Manual
<b>QoS Policy</b>	<input checked="" type="radio"/> Voice Packet <input type="radio"/> All

- **State:** Administrator can choose Enable or Disable this function.
- **VLAN:** Administrator can choose VLAN.
- **CoS / 802.1P Remarking:** Administrator can set CoS 802.1p priority level for the VLAN.
- **Port Aging Time:** Administrator can set aging time for this rule.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 6.2.2 Voice OUI

Organizationally Unique Identifiers (OUI) is the first three bytes of a MAC Address, while the last three bytes contain a unique station ID. Administrator can add a specific manufacturer with the OUI. Once the OUI is added, all traffic received on voice VLAN ports from the specific IP phone with a listed OUI is forwarded on the voice VLAN. Unlike the telephony OUI mode that detects voice devices based on telephony OUI, Auto Voice VLAN mode depends on auto smart port to dynamically add the ports to the voice VLAN. The default has set 8 companies for the voice phone.

**VLAN → Voice VLAN → Voice OUI**

<b>Description</b>	Display description of OUI entry.

#### Edit Voice OUI

<b>OUI</b>	00:03:6B
<b>Description</b>	<input style="width: 90%;" type="text" value="Cisco"/>

Administrator can create new OUI or modify or delete OUI in table

Click **“add”** button can create new OUI.

Click **“Edit”** button can modify OUI data.

Click **“Delete”** button can delete OUI data.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 6.3 Protocol VLAN

### 6.3.1 Protocol Group

Administrator can configure this page to add or edit groups settings of protocol VLAN, Setting “add” and “Edit” and “Delete” function for this management.

Group ID	Frame Type	Protocol Value
1	RFC_1042	0x0600
2	IEEE802.3_LLC_Other	0x0601

Field	Description
Group ID	Display group ID of entry.
Frame Type	Display frame type of entry.
Protocol Value	Display protocol value of entry.

- **Group ID** : Select group ID of list. The range from 1 to 8.
- **Frame Type** : Select frame type of list that maps packets to protocol-defined VLANs by

examining the type octet within the packet header to discover the type of protocol associated with it.

- **Ethernet\_II** : packet type is Ethernet version 2.
  - **IEEE802.3\_LLC\_Other** : packet type is 802.3 packet with LLC other header.
  - **RFC\_1042** : packet type is rfc 1042 packet.
- **Protocol Value** : Input protocol value of the target protocol. Packets match this protocol value classified to specified VLAN ID.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 6.3.2 Group Binding

Administrator can configure this bind protocol VLAN group to each port with VLAN ID, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

**VLAN → Protocol VLAN → Group Binding**

Group Binding Table

Showing All entries Showing 1 to 2 of 2 entries

<input type="checkbox"/>	Port	Group ID	VLAN
<input type="checkbox"/>	GE5	2	4094
<input type="checkbox"/>	GE6	2	4094

Add Edit Delete

Field	Description
Port	Display port ID that binding with protocol group entry.
Group ID	Display group ID that port binding with.
VLAN	Display VLAN ID that assign to packets which match protocol group.

### Add Group Binding

	Available Port		Selected Port
<b>Port</b>	<div style="border: 1px solid #ccc; padding: 5px;">                     GE3 GE4 GE7 GE8 GE9 GE10                 </div>	<div style="display: flex; flex-direction: column; align-items: center;"> <span style="font-size: 24px; margin-bottom: 5px;">&gt;</span> <span style="font-size: 24px; margin-top: 5px;">&lt;</span> </div>	<div style="border: 1px solid #ccc; padding: 5px;">                     GE5 GE6                 </div>
Note: Only VLAN Hybrid port can be set Protocol VLAN			
<b>Group ID</b>	<div style="border: 1px solid #ccc; padding: 2px;">2</div>		
<b>VLAN</b>	<div style="border: 1px solid #ccc; padding: 2px;">4094</div> (1 - 4094)		

- **Port** : Select ports in left box then move to right to binding with protocol group. Or select ports in right box then move to left to unbind with protocol group. Only interface has hybrid VLAN mode can be selected and bound with protocol group. Only available on Add dialog.
- **Group ID** : Select a Group ID to associate with port. Only available on Add dialog.
- **VLAN** : Input VLAN ID that will assign to packets which match protocol group.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 6.4 MAC VLAN

### 6.4.1 MAC Group

The MAC VLAN feature allows incoming untagged packets to be assigned to a VLAN and thus classify traffic based on the source MAC address of the packet. You define a MAC to VLAN mapping by configuring an entry in the MAC to VLAN table. An entry is specified using a source MAC address and the appropriate VLAN ID. The MAC to VLAN configurations are shared across all ports of the device (i.e., there is a system-wide table that has MAC address to VLAN ID mappings).

When untagged or priority tagged packets arrive at the switch and entries exist in the MAC to VLAN table, the source MAC address of the packet is looked up. If an entry is found, the corresponding VLAN ID is assigned to the packet. If the packet is already priority tagged it will maintain this value;

otherwise, the priority will be set to 0 (zero). The assigned VLAN ID is verified against the VLAN table. If the VLAN is valid, ingress processing on the packet continues; otherwise, the packet is dropped. This implies that you can configure a MAC address mapping to a VLAN that has not been created on the system, Setting “add” and “Edit” and “Delete” function for this management.

**VLAN → MAC VLAN → MAC Group**

MAC Group Table

Showing All entries Showing 1 to 1 of 1 entries

<input type="checkbox"/>	Group ID	MAC Address	Mask
<input type="checkbox"/>	215	8C:4D:EA:FE:CC:AE	24

- **Port** : Display selected port to be edited.
- **State** : Set checkbox to enable/disabled Surveillance VLAN function of interface.
- **Mode** : Select port Surveillance VLAN mode.

- **Auto** : Video VLAN auto detect packets that match OUI table and add received port into surveillance VLAN ID tagged member.
- **Manual** : User need add interface to VLAN ID tagged member manually.
- **QoS Policy** : Select port QoS Policy mode.
  - **Video Packet** : Video Packet: QoS attributes are applied to packets with OUIs in the source MAC address.
  - **All** : QoS attributes are applied to packets that are classified to the Surveillance VLAN.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 6.5.2 Surveillance OUI

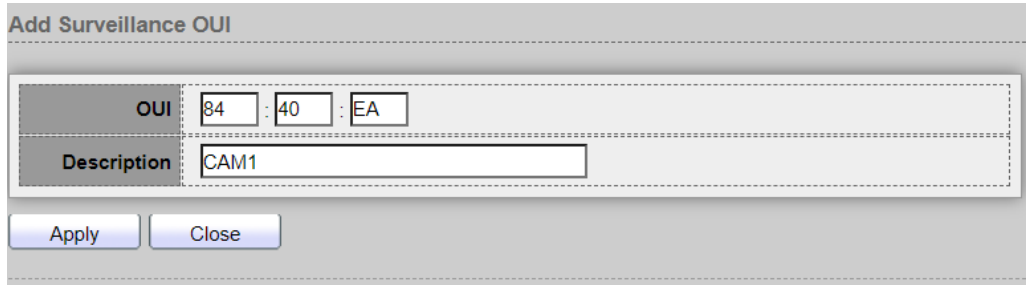

Administrator can configure this page to add, edit or delete OUI MAC addresses, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

Field	Description
OUI	Display OUI MAC address.

---

**Description**                      Display description of OUI entry.

---

Add Surveillance OUI			
OUI	84	40	EA
Description	CAM1		

Apply      Close

- **OUI** : Input OUI MAC address. Can't be edited in edit dialog. .
- **Description** : Input description of the specified MAC address to the Surveillance VLAN OUI table.

*Click the “Apply” button to save your changes or “Close” the button to close settings.*

## 6.6 GVRP

The GVRP (Generic VLAN Registration Protocol) is described in the IEEE 802.1p standard; It's an IEEE 802.1Q-compliant method for facilitating automatic (dynamic) VLAN membership configuration. GVRP-enabled switches can exchange VLAN configuration information with other GVRP-enabled switches.

Policy rules or other network management methods can determine who is admitted to a VLAN. When a node requests admission to a specific VLAN, GVRP handles the registration of the node with GVRP-enabled switches and maintains that information.

GVRP reduces the chance of errors in VLAN configuration by automatically providing VLAN ID (VID) consistency across the network. In addition, you can use GVRP to dynamically enable port membership in static VLANs configured on a switch. Once GVRP creates a dynamic VLAN will can also reduce unnecessary broadcast traffic and unicast traffic.

## 6.6.1 Property

Administrator can enable GVRP function and set every port registration on GVRP.

Entry	Port	State	VLAN Creation	Registration
1	GE1	Disabled	Enabled	Normal
2	GE2	Disabled	Enabled	Fixed
3	GE3	Disabled	Enabled	Fixed
4	GE4	Disabled	Enabled	Fixed

- **State** : Set the enabling status of GVRP functionality
  - **Enable:** if Checked Enable GVRP, else is Disable GVRP.
- **Operational Timeout:** The port will not learn any dynamic VLAN. Only send static VLAN information to
  - **Join.:** GVRP Join time out.
  - **Leave:** GVRP leave time out.

Click the **“Apply”** button to save your changes settings.

Field	Description
Port	Port Name.
State	Display port GVRP state.
VLAN Creation	Display port GVRP creation VLAN state.
Registration	Display port GVRP registration mode.

**Edit Port Setting**

<b>Port</b>	GE2-GE4
<b>State</b>	<input type="checkbox"/> Enable
<b>VLAN Creation</b>	<input checked="" type="checkbox"/> Enable
<b>Registration</b>	<input type="radio"/> Normal <input checked="" type="radio"/> Fixed <input type="radio"/> Forbidden

- **Port:** Display port number.
- **State:** Displays whether GVRP is enabled or disabled on the interface.
- **VLAN Creation:** Displays whether Dynamic VLAN creation is enabled or disabled on the interface. If it is disabled, GVRP can operate but new VLANs are not created.
- **Registration:** Displays the VLAN registration mode on the interface.
  - **Normal: Normal mode..**
  - **Fixed:** The port will not learn any dynamic VLAN. Only send static VLAN information to neighbor and allow static VLAN packet pass..
  - **Forbidden:** The port will not learn any dynamic VLAN and only allow default VLAN packet pass.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 6.6.2 Member ship

When enable GVRP function and state ports in GVRP then administrator can check GVRP member information.

**VLAN → GVRP → Membership**

<input type="checkbox"/>	1	00:60:B9:BF:B6:74	GE25
<input type="checkbox"/>	1	00:E0:A0:10:04:6C	GE25

- **Aging Time** : The time in seconds that an entry remains in the MAC address table. Its valid range is from 10 to 630 seconds, and the default value is 300 seconds.

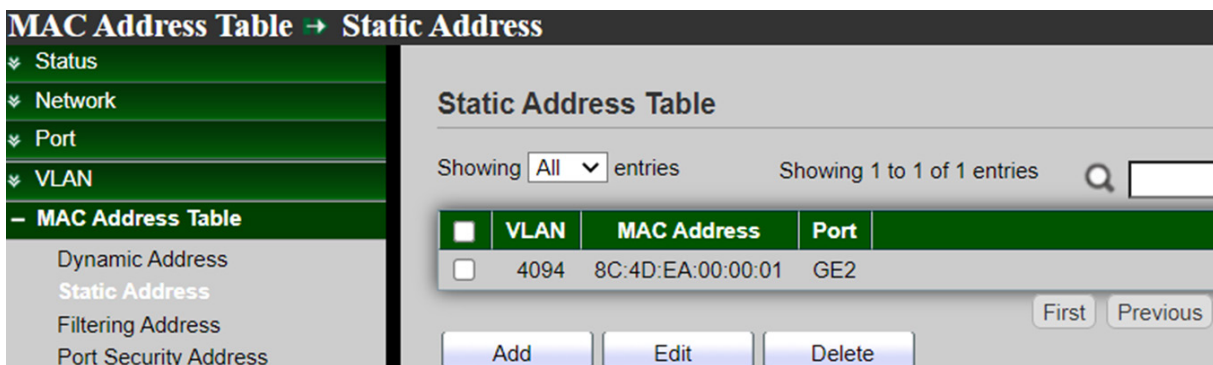

Click the **“Apply”** button to save your changes settings.

Field	Description
<b>MAC Address</b>	The MAC address to which packets will be statically forwarded.
<b>VLAN</b>	Specify the VLAN to show or clear MAC entries.
<b>Port</b>	Interface or port number.

When administrator select checkbox MACs address and click “**Add Static Address**” button then selected MAC address will move to “**Static Address**” function.

## 7.2 Static Address

If administrator fixed an MAC address in the port then device MAC address will bind in the port, if device connection other port will can't working only connection bind port, Setting “**add**” and “**Edit**” and “**Delete**” function for this management.

Field	Description
<b>MAC Address</b>	The MAC address to which packets will be statically forwarded.
<b>VLAN</b>	Specify the VLAN to show or clear MAC entries.
<b>Port</b>	Interface or port number.

**Add Static Address**

---

<b>MAC Address</b>	<input type="text" value="8C:4D:EA:00:00:01"/>
<b>VLAN</b>	<input type="text" value="4094"/> (1 - 4094)
<b>Port</b>	<input type="text" value="GE1"/>

- **MAC Address** : Enter the MAC address to which packets will be statically forwarded.
- **VLAN** : Enter the Specify the VLAN ID
- **Port** : Select an interface or port number.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 7.3 Filtering Address

Administrator can set need filtering MAC address in the MAC table. If MAC is added on table this MAC will be blocked, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

**MAC Address Table → Filtering Address**

- ⌵ Status
- ⌵ Network

- Port Security Address

**Filtering Address Table**

Showing  entries      Showing 1 to 1 of 1 entries

	VLAN	MAC Address	
<input type="checkbox"/>	4094	8C:4D:EA:00:00:0E	

Field	Description
<b>MAC Address</b>	Specify unicast MAC address in the packets to be dropped.
<b>VLAN</b>	Specify the VLAN ID for the specific MAC address.

**Add Filtering Address**

---

<b>MAC Address</b>	<input type="text" value="8C:4D:EA:00:00:0E"/>
<b>VLAN</b>	<input type="text" value="4094"/> (1 - 4094)

- **MAC Address** : Enter to specify the unicast MAC address in the packets to be dropped.
- **VLAN** : Enter a VLAN ID that specifies a specific MAC address.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 7.4 Port Security Address

Administrator can set this Port Security Address function, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

**MAC Address Table → Port Security Address**

- Status
- Network
- Port
- VLAN
- MAC Address Table

- Port Security Address

**Port Security Address Table**

Showing All entries      Showing 1 to 1 of 1 entries

<input type="checkbox"/>	VLAN	MAC Address	Type	Port
<input type="checkbox"/>	4094	8C:4D:EA:00:08:0A	SecureConfigured	GE5

1

Field	Description
<b>VLAN</b>	Specify the VLAN to show port security.
<b>MAC Address</b>	Specify the MAC address for port security.
<b>Type</b>	Specify the Type for port security.
<b>Port</b>	Interface or port number.

Add Port Security Address

MAC Address	<input type="text" value="8C:4D:EA:00:08:0A"/>
VLAN	<input type="text" value="4094"/> (1 - 4094)
Port	<input type="text" value="GE5"/>

- **MAC Address** : Enter the MAC address for port security.
- **VLAN** : Enter the Specify the VLAN ID
- **Port** : Select an interface or port number.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 8. Spanning Tree

Spanning Tree function allows only one active path at a time between any two network devices (this prevents the loops) but establishes the redundant links as a backup if the initial link should fail. If Spanning Tree costs change, or if one network segment in the Spanning Tree becomes unreachable, the spanning tree algorithm reconfigures the spanning tree topology and reestablishes the link by activating the standby path. Without spanning tree in place, it is possible that both connections may be simultaneously live, which could result in an endless loop of traffic on the LAN.

## 8.1 Property

**Spanning Tree → Property**

- ▼ Status
- ▼ Network
- ▼ Port
- ▼ VLAN
- ▼ MAC Address Table
- ▼ **Spanning Tree**
  - Property
  - Port Setting
  - MST Instance
  - MST Port Setting
  - Statistics

- ▼ Discovery
- ▼ DHCP
- ▼ Multicast
- ▼ IP Configuration
- ▼ Security
- ▼ ACL
- ▼ QoS
- ▼ Diagnostics
- ▼ Management

<b>State</b>	<input type="checkbox"/> Enable
<b>Operation Mode</b>	<input type="radio"/> STP <input checked="" type="radio"/> RSTP <input type="radio"/> MSTP
<b>Path Cost</b>	<input checked="" type="radio"/> Long <input type="radio"/> Short
<b>BPDU Handling</b>	<input type="radio"/> Filtering <input checked="" type="radio"/> Flooding
<b>Priority</b>	<input type="text" value="32768"/> (0 - 61440, default 32768)
<b>Hello Time</b>	<input type="text" value="2"/> Sec (1 - 10, default 2)
<b>Max Age</b>	<input type="text" value="20"/> Sec (6 - 40, default 20)
<b>Forward Delay</b>	<input type="text" value="15"/> Sec (4 - 30, default 15)
<b>Tx Hold Count</b>	<input type="text" value="6"/> (1 - 10, default 6)
<b>Region Name</b>	<input type="text" value="8C:4D:EA:30:DD:53"/>
<b>Revision</b>	<input type="text" value="0"/> (0 - 65535, default 0)

- **State:** Administrator can choose Enable or Disable this function.
- **Operation Mode:** Administrator can choose use Spanning Tree (STP) or Rapid Spanning Tree (RSTP) or Multiple Spanning Tree (MSTP).
- **Path Cost:** Administrator can choose STP judgment use Path cost for Long or Short.
  - **Long :** Specifies that the default port path costs are within the range: 1-200,000,000.
  - **Short:** Specifies that the default port path costs are within the range:1-65,535.
- **BPDU Handling:** When the Switch receives the BPDU frame, Administrator can choose the BPDU Handling mode for Filtering or Flooding. Specify the BPDU forward method when the STP is disabled.
  - **Filtering :** Filter the BPDU when STP is disabled.
  - **Flooding :** Flood the BPDU when STP is disabled.
- **Priority:** Administrator can set bridge priority, default is 32768. The lower value (priority) is the root bridge. Specify the bridge priority. The valid range is from 0 to 61440, and the value should be the multiple of 4096. It ensures the probability that the switch is selected as the root bridge, and the lower value has the higher priority for the switch to be selected as the root bridge of the topology.

- **Hello Time:** The hello time is the time between each bridge protocol data unit (BPDU) that is sent on a port. This time is equal to 2 seconds (sec) by default, but you can tune the time to be between 1 and 10 sec.
- **Max. Age / Forward delay :**  $2 * (\text{Forward Delay} - 1) \geq \text{Max Age} \geq 2 * (\text{Hello Time} + 1)$ , the time interval in seconds for a switch to wait the configuration messages, without attempting to redefine its own configuration.
- **Forward Delay :** Specify the STP forward delay time, which is the amount of time that a port remains in the Listening and Learning states before it enters the Forwarding state. Its valid range is from 4 to 10 seconds.
- **TX hold Count:** Specify the tx-hold-count used to limit the maximum numbers of packets transmission per second. The valid range is from 1 to 10.
- **Region Name:** The MSTP instance name. Its maximum length is 32 characters. The default value is the MAC address of the switch.
- **Revision:** Administrator every time change MST value, customary "Revision" to add 1 value. The MSTP revision number. Its valid range is from 0 to 65535.
- **Max. Hop:** Set max. hop of switch. Specify the number of hops in an MSTP region before the BPDU is discarded. The valid range is 1 to 40.

## 8.2 Port Setting

Spanning Tree → Port Setting									
✖ Status

<input checked="" type="checkbox"/>	2	GE2	Enabled	20000	48	Enabled	Enabled	Enabled	
<input checked="" type="checkbox"/>	3	GE3	Enabled	20000	48	Enabled	Enabled	Enabled	
<input checked="" type="checkbox"/>	4	GE4	Enabled	20000	48	Enabled	Enabled	Enabled	
<input checked="" type="checkbox"/>	5	GE5	Enabled	20000	48	Enabled	Enabled	Enabled	

Field	Description
<b>Port</b>	Specify the interface ID or the list of interface IDs.
<b>State</b>	The operational state on the specified port.
<b>Path Cost</b>	STP path cost on the specified port.
<b>Priority</b>	STP priority on the specified port.
<b>BPDU Filter</b>	The states of BPDU filter on the specified port.
<b>BPDU Guard</b>	The states of BPDU guard on the specified port.
<b>Operational Edge</b>	The operational edge port status on the specified port.
<b>Operational Point-to-Point</b>	The operational point-to-point status on the specified port.
<b>Port Role</b>	The current port role on the specified port. The possible values are: "Disabled", "Master", "Root", "Designated", "Alternative", and Backup".
<b>Port State</b>	The current port state on the specified port. The possible values are: "Disabled", "Discarding", "Learning", and "Forwarding".
<b>Designated Bridge</b>	The bridge ID of the designated bridge.
<b>Designated Port ID</b>	The designated port ID on the switch.
<b>Designated Cost</b>	The path cost of the designated port on the switch

### Edit Port Setting

<b>Port</b>	GE2-GE5,LAG1
<b>State</b>	<input checked="" type="checkbox"/> Enable
<b>Path Cost</b>	<input type="text" value="0"/> (0 - 200000000) (0 = Auto)
<b>Priority</b>	<input type="text" value="128"/> ▾
<b>Edge Port</b>	<input checked="" type="radio"/> Auto <input type="radio"/> Enable <input type="radio"/> Disable
<b>BPDU Filter</b>	<input checked="" type="checkbox"/> Enable
<b>BPDU Guard</b>	<input type="checkbox"/> Enable
<b>Point-to-Point</b>	<input type="radio"/> Auto <input checked="" type="radio"/> Enable <input type="radio"/> Disable
<b>Port State</b>	Disabled
<b>Designated Bridge</b>	0-00:00:00:00:00:00
<b>Designated Port ID</b>	128-29
<b>Designated Cost</b>	20000
<b>Operational Edge</b>	False
<b>Operational Point-to-Point</b>	False

- **State:** Administrator can set Enable or Disable.
- **Path Cost:** Path Cost (1-200000000) This parameter is used determine the best path between devices. Therefore, lower values should be assigned to ports attached to faster media, and higher values assigned to ports with slower media. (Path cost takes precedence over port priority.) Note that when the Path Cost Method is set to short, the maximum path cost is 65,535. Range: 1-200000000, (set 0 = Auto, default is 0).
- **Priority:** If the path cost for all ports on a switch is the same, the port with the highest priority (i.e., lowest value) will be configured as an active link in the Spanning Tree. Where more than one port is assigned the highest priority, the port with lowest numeric identifier will be enabled. Range: 0-240, default is 128.
- **Edge Port:** Specify the edge mode..
  - **Enable** : Force to true state (as link to a host).
  - **Disable** : Force to false state (as link to a bridge).

In the edge mode, the interface would be put into the Forwarding state immediately upon link up. If the edge mode is enabled for the interface and there are BPDUs received on the

interface, the loop might be occurred in the short time before the STP state change.

- **BPDU Filter** : The BPDU Filter configuration avoids receiving/transmitting BPDU from the specified ports.
  - **Enable** : Enable BPDU filter function.
  - **Disable** : Disable BPDU filter function.
- **BPDU Filter** : The BPDU Guard configuration to drop the received BPDU directly.
  - **Enable** : Enable BPDU guard function.
  - **Disable** : Disable BPDU guard function.
- **Point-to-Point** : Specify the Point-to-Point port configuration:
  - **Auto** : The state is depended on the duplex setting of the port.
  - **Enable** : Force to true state.
  - **Disable**: Force to false state.
- **Port State** : The current port state on the specified port. The possible values are : “Disabled”, “Discarding”, “Learning”, and “Forwarding”.
- **Designated Bridge** : The bridge ID of the designated bridge.
- **Designated Port ID** : The designated port ID on the switch.
- **Designated Cost** : The path cost of the designated port on the switch.
- **Operational Edge** : Show the “false” and “true” status.
- **Operational Point-to-Point** : Show the “false” and “true” status.

Click the “**Apply**” button to save your changes or “**Close**” the button to close settings.

## 8.3 MST Instance

MST can have multiple sets of STP instances. Each instance is independently formed as a logical spanning tree. And instance has its own VLAN and port state, can independently set the priority of each port.

<input type="radio"/>	13	32768	32768-8C:4D:EA:30:DD:53	0-00:00:00:00:00:00	N/A	0	0	

Field	Description
<b>MSTI</b>	MST instance ID.
<b>Priority</b>	The bridge priority on the specified MSTI.
<b>Bridge Identifier</b>	The bridge identifier on the specified MSTI.
<b>Designated Root Bridge</b>	The designated root bridge identifier on the specified MSTI.
<b>Root Port</b>	The designated root port on the specified MSTI.
<b>Root Path Cost</b>	The designated root path cost on the specified MSTI.
<b>Remaining Hop</b>	The configuration of remaining hop on the specified MSTI.
<b>VLAN</b>	The VLAN configuration on the specified MSTI.

**Edit MST Instance Setting**

<b>MSTI</b>	3	
<b>VLAN</b>	Available VLAN	Selected VLAN
	<div style="border: 1px solid #ccc; padding: 5px;">                 2 3 4 6 7 8 9 10             </div>	<div style="border: 1px solid #ccc; padding: 5px;">                 1 5             </div>
<b>Priority</b>	<input style="width: 100%;" type="text" value="32768"/> (0 - 61440, default 32768)	
<b>Bridge Identifier</b>	32768-8C:4D:EA:30:DD:53	
<b>Designated Root Bridge</b>	0-00:00:00:00:00:00	
<b>Root Port</b>		
<b>Root Path Cost</b>	0	
<b>Remaining Hop</b>	0	

- **VLAN** : Select the VLAN list for the specified MSTI.
- **Priority**: Specify the bridge priority on the specified MSTI. The valid range is from 0 to 61440, and the value must be the multiple of 4096. It ensures the probability that the switch is selected as the root bridge, and the lower values has the higher priority for the switch to be selected as the root bridge of the STP topology.
- **Bridge Identifier**: Displays the priority and MAC address of the Root Bridge for the selected MST instance.
- **Root Port**: Displays the root port of the selected MST instance.
- **Root Path Cost**: Displays the root path cost of the selected MST instance.
- **Remaining Hops**: Displays the number of hops remaining to the next destination.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 8.4 MST Port Setting

MST (Multiple Spanning Tree) is an extension to RST (Rapid Spanning Tree). MST further develops the usefulness of VLANs. MST configures a separate spanning tree for each VLAN group and blocks all but one possible alternate path within each spanning tree. A Multiple Spanning Tree Instance (MSTI) calculates and builds a loop-free topology to bridge packets from the VLANs that map to the instance.

MST Port Settings is used to configure the port MSTP settings for every MST instance. It is also used to view statistics that have been learned from the protocol.

Field	Description
MSTI	Specify the port setting on the specified MSTI
Port	Specify the interface ID or the list of interface IDs.
Path Cost	The port path cost on the specified MSTI.
Priority	The port priority on the specified MSTI.
Port Role	The current port role on the specified port. The possible values are: "Disabled", "Master", "Root", "Designated", "Alternative", and "Backup".
Port State	The current port state on the specified port. The possible values are: "Disabled", "Discarding", "Learning", and "Forwarding".
Mode	The operational STP mode on the specified port.
Type	The possible value for the port type are: <ul style="list-style-type: none"> <li>• <b>Boundary:</b> The port attaching an MST Bridge to a LAN that is not in the same region.</li> <li>• <b>Internal:</b> The port attaching an MST Bridge to a LAN that is not in the same region.</li> </ul>
Designated Bridge	The bridge ID of the designated bridge.

<b>Designated Port ID</b>	The designated port ID on the switch.
<b>Designated Cost</b>	The path cost of the designated port on the switch.
<b>Remaining Hop</b>	The remaining hops count on the specified port.

**Edit MST Port Setting**

<b>MSTI</b>	0	
<b>Port</b>	GE6-GE7	
<b>Path Cost</b>	<input style="width: 150px;" type="text" value="0"/>	(0 - 200000000) (0 = Auto)
<b>Priority</b>	128 ▼	
<b>Port Role</b>	Disabled	
<b>Port State</b>	Disabled	
<b>Mode</b>	RSTP	
<b>Type</b>	Boundary	
<b>Designated Bridge</b>	0-00:00:00:00:00:00	
<b>Designated Port ID</b>	128-6	
<b>Designated Cost</b>	20000	
<b>Remaining Hop</b>	20	

- **MTSI** : Specify the port setting on the specified MSTI.
- **Port** : Specify the interface ID or the list of interface IDs..
- **Path Cost**: Specify the STP port path cost on the specified MSTI,Path cost default value is 0 (auto) depends on source device rate.  
 If network is a loop occurs, the MST uses cost when selecting an interface to put in the forwarding state. Administrator can assign lower cost values to interfaces that you want selected first and higher cost values that you want selected last. If all interfaces have the same cost value, the MST puts the interface with the lowest interface number in the forwarding state and blocks the other interfaces.
- **Priority**: Specify the STP port priority on the specified MSTI,Administrator can configure the MTP priority and make it more likely that the switch will be chosen as the root switch.
- **Port Role**: Displays the port role per instance, assigned by the MSTP algorithm to provide STP paths. The current port role on the specified port. The possible values are :

“Disabled”, “Master”, “Root”, “Designated”, “Alternative”, and “Backup”.

- **Port State:** The current port state on the specified port. The possible values are: “Disabled”, “Discarding”, “Learning”, and “Forwarding”.
- **Mode:** The operational STP mode on the specified port.
  - **RSTP:** RSTP is enabled on the port.
  - **STP:** Classic STP is enabled on the port.
  - **MSTP:** MSTP is enabled on the port.
- **Type :** Displays the MSTP type of the port. The possible value for the port type are :
  - **Boundary :** The port attaching an MST Bridge to a LAN that is not in the same region.
  - **Internal:** The port attaching an MST Bridge to a LAN that is not in the same region.
- **Designated Bridge:** Displays the bridge ID number that connects the link or shared LAN to the root.
- **Designated Port ID:** Displays the priority and port ID on the designated bridge that connects the link or the shared LAN to the root.
- **Designated Cost:** Displays the cost of the port participating in the STP topology. Ports with a lower cost are less likely to be blocked if STP detects loops.
- **Remaining Hops :** Displays the hops remaining to the next destination.

Click the “Apply” button to save your changes or “Close” the button to close settings.

## 9. ERPS

**ERPS (Ethernet Ring Protection Switching) :** In Ethernet switching networks such as ring networks, redundant links are generally used to provide link backup and enhance network reliability. However, using redundant links can create network loops, cause broadcast storms, and cause MAC address table instability. As a result, communication quality deteriorates, and even communication services are interrupted.

STP (Spanning Tree Protocol), RSTP (Rapid Spanning Tree Protocol), and MSTP (Multiple Spanning Tree Protocol) can also meet the reliability requirements of the network, but the convergence speed is slow and does not meet the industry standard requirements.

The first industrial standard Ethernet ring redundancy protocol (ITU-T G.8032), used for link backup, improving network reliability, Ethernet networks need faster ERPS function protection switch.

Complementary STP cannot meet the requirement of fast convergence. ERPS is an ITU-T standard protocol used to prevent ring network loops. It optimizes detection and performs fast convergence. ERPS allows all ERPS-capable devices on the ring network to communicate.

**As shown in Figure sample-1 => Typical networking**

Figure sample ERPS link is normal

ERPS is a standard ring network protocol dedicated to the Ethernet link layer, with the ERPS ring as the basic unit. Only two ports on each Layer 2 switching device can join the same ERPS ring. In the ERPS ring, in order to prevent loops, you can start the loop breaking mechanism, block the RPL owner port, and eliminate the loop. When a link failure occurs on the ring network, the device running the ERPS protocol can quickly unblock the blocked port and perform link protection switching..

**As shown in Figure sample-2 => The link is failure**

**Figure sample ERPS link is normal**

All devices on the ring consisting of Switch A to Switch E communicate normally. To prevent loops, ERPS will first block the RPL owner port. If an RPL neighbor port is configured, this port will also be blocked, and other ports can forward service traffic normally.

As shown in Figure sample-3 => The link is failure

Figure sample ERPS link is failure

When the link between Switch D and Switch E fails, the ERPS protocol starts the protection switching mechanism, blocks the ports at both ends of the faulty link, and releases the RPL owner port. The port resumes receiving and sending user traffic, thus ensuring uninterrupted traffic.

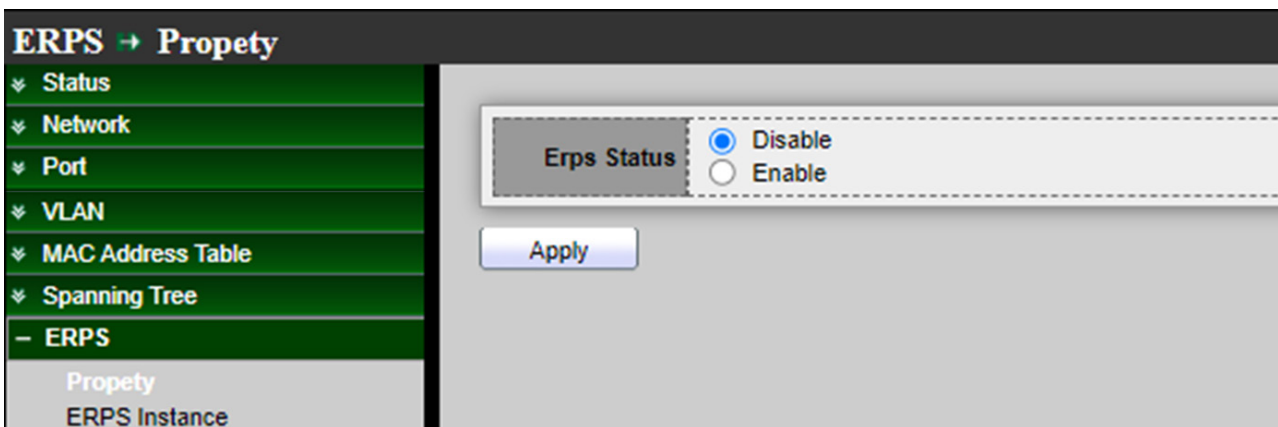

<b>Note</b>	After the link returns to normal, the ERPS ring is configured in switchback mode by default. The device where the RPL owner port is located will block the traffic on the RPL link again, and the original faulty link will be used to complete the transmission of user traffic.
-------------	---

## 9.1 Propely

In a network with ring topology that runs ERPS, only one switch is assigned as an “owner” that is responsible for blocking traffic in RPL so as to avoid loops. The switch adjacent to the RPL owner is called the RPL “neighbor” node that is responsible for blocking its end of the RPL under normal condition. Other participating switches adjacent to the RPL owner or neighbor in a ring are members or RPL next-neighbor nodes to this topology and normally forward receive traffic. ERPS, like STP, provides a loop-free network by using polling packets to detect faults. When a fault occurs, ERPS heals itself by sending traffic over a protected reverse path less than 50ms and recover quickly to forward traffic. Because of this fault detection mechanism, the network broadcast storm problem could be avoided as well.

Ethernet Ring Protection Switch (ERPS) is an Ethernet ring protection protocol which is used to prevent forming the loop in LAN, thus, the Broadcast Storm problem could be avoided. The loop avoidance mechanism ensures the traffic flows on all but the RPL ring link. In order to achieve the loop-avoidance mechanism, ITU-T G.8032 defines three roles in ERPS, which are “RPL Owner Node”, “RPL Neighbor Node”, and “None Node”.

Administrator can configure this “ERPS “for Enable / Disable ERPS function.

Click the “**Apply**” button to save your changes settings.

## 9.2 ERPS Instance Setting

Below, Click and edit to configuration interface “Ins” Setting.

Administrator can configure this “ERPS Instance” for Ring Instance config function.

Instance	Ring Status	Mel	Control Vlan	WTR Time	Guard Time	Work Mode	Ring ID	Ring Type
<input checked="" type="checkbox"/> Ins0	Disabled	0	0	5	500	revertive	1	0
<input type="checkbox"/> Ins1	Disabled	0	0	5	500	non_revertive	1	0
<input type="checkbox"/> Ins2	---					---		

**Note** Before configuring ERPS, the rapid spanning tree protocol (RSTP), or multiple spanning tree protocol is required to disabled, due to only one protocol is exclusive running within a switch.

➤ **ERPS Instance:** The ID of the ERPS interface.

Click the “**Apply**” button to save your changes settings.

## ERPS Instance Setting

<input type="checkbox"/>	Instance	Ring Status	Mel	Control Vlan	WTR Time	Guard Time	Work Mode	Ring ID	Ring Type
<input checked="" type="checkbox"/>	Ins0	Disabled	0	0	5	500	revertive	1	0
<input type="checkbox"/>	Ins1	Disabled	0	0	5	500	non_revertive	1	0
<input type="checkbox"/>	Ins2	---					---		
<input type="checkbox"/>	Ins3	---					---		

Protected Instance	Port0	Port Role	Port Status	Port1	Port Role	Port Status	Node Status
---	gi1	rpl	disabled	gi1	rpl	disabled	init
---	gi1	rpl	disabled	gi1	rpl	disabled	init

Field	Description
-------	-------------

<b>Instance</b>	The ID of the ERPS , The ID of the Protection group.
-----------------	--

<b>Ring Status</b>	Display Enable or Disable the Ring.
--------------------	-------------------------------------

<b>Mel</b>	Display MEL for the Ring.
------------	---------------------------

<b>Control VLAN</b>	Display the control VLAN ID.
---------------------	------------------------------

<b>WTR Time</b>	The Wait To Restore timing value to be used in revertive switching. The period of the WTR time can be configured by the operator in 1 minute steps between 5 and 12 minutes with a default value of 5 minutes.
-----------------	---

<b>Guard Time</b>	Guard timeout value to be used to prevent ring nodes from receiving outdated R-APS messages. The period of the guard timer can be configured in 100 ms steps between 100 ms and 2000ms( 2 seconds), with a default value of 500 ms
-------------------	---

<b>Work Mode</b>	Display Revertive or Non_revertive mode. <ul style="list-style-type: none"> <li>• <b>In Revertive mode</b> : after the conditions causing a protection switch has cleared,the traffic channel is restored to the working transport entity, i.e., blocked on the RPL</li> <li>• <b>In Non-Revertive mode</b> : the traffic channel continues to use the RPL, if</li> </ul>
------------------	---

it is not failed, after a protection switch condition has cleared.

<b>Ring ID</b>	Display ring ID
<b>Ring Type</b>	Display ring type "0" for Master-ring or "1" for Sub-ring.
<b>Protected Instance</b>	Protection instance of ERPS ring instance.
<b>Prot0</b>	The port0(left port) for this node.
<b>Port Role</b>	Current port0 rule status.
<b>Port Status</b>	Display the port0 port(left port) status.
<b>Port1</b>	The port1(right port) for this node.
<b>Port Role</b>	Current port1 rule status.
<b>Port Status</b>	Display the port1 port(right port)status.
<b>Node Status</b>	<p>Shows the following ERPS states:</p> <p><b>Init</b> : The ERPS ring has started but has not yet determined the status of the ring.</p> <p><b>Idle</b> : If all nodes in a ring are in this state, it means that all the links in the ring are up. This state will switch to protection state if a link failure occurs.</p> <p><b>Protection</b> : If a node in this state, it means that a link failure has occurred. This state will switch to idle state if all the failed links recover.</p>

**Ring Instance Config**

Ins	1
Ring Status	<input checked="" type="radio"/> Disable <input type="radio"/> Enable
Mel	0 (Valid range is 0-7)
Protected Instance	0 (Valid range is 0-15)
Control Vlan	0 (Valid range is 1-4094)
WTR Time	5 (Valid range is 1-12 Min Default is 5 Min)
Guard Time	500 (Valid range is 100-2000 ms. Default is 500 ms)
Work Mode	<input checked="" type="radio"/> Revertive <input type="radio"/> Non_revertive
Ring ID	1 (Valid range is 1-239)
Ring Type	0 (0-master ring, 1-sub ring)
Port0	GE1
Port0 Role	<input checked="" type="radio"/> Normal <input type="radio"/> owner <input type="radio"/> neighbour <input type="radio"/> next-neighbour
Port1	GE1
Port1 Role	<input checked="" type="radio"/> Normal <input type="radio"/> owner <input type="radio"/> neighbour <input type="radio"/> next-neighbour

Apply Close

- **Ring Status** : Enables/disables the ring status.
  - **Disable** : Disable the Ins for ERPS protocol.
  - **Enable** : Enable the Ins for ERPS protocol.
- **Mel** : Configures the control MEL for the ring. Valid values are from 0 to 7, Default is 0.

<b>Note</b>	<p>The ring maintenance entity group level (MEL) provides a communication channel for ring automatic protecting switching (R-APS) information. On a layer 2 network running ERPS, if another fault detection protocol is enabled, the MEL field in the RAPS PDU will determine whether these packets can be forwarded. If the MEL value of the ERPS ring is less than the MEL value of the fault detection protocol, the data packet has a lower priority and is discarded. In addition, the MEL value can also be used to facilitate communication with equipment from different vendors in the ERPS ring. The same MEL value can ensure smooth communication between multi-vendor devices. The recommended setting for MEL is 7. In networks that have a main ring and a sub ring, the MEL for both rings should be set to 7.</p>
-------------	---

- **Protected Instance** : The valid 0-15 protected-instance setting to configures Ethernet ring protection (ERP) instances in an ERPS ring.
- **Control VLAN** : The control VLAN of the instance should be the same as it is under Control VLAN,ERPS Control VLAN ID, ranges from 1 to 4094. It's aVLAN ID to send PDUs of ERPS.

<b>Note</b>	In the ERPS ring, the control VLAN is only used to forward RAPS PDUs, thereby improving the security of the ERPS protocol. All devices in the ERPS ring must be configured with the same control VLAN. Other VLANs cannot use the same ID as the control VLAN. For example, if the standard VLAN 20 already exists in the VLAN configuration, you cannot set VLAN 20 as the control VLAN of the ERPS ring.
-------------	--

- **WTR Time** : Configures the WTR time for the ring. Valid values are between 1 and 12 (min) , Default is 5min.
- **Guard Time** : Configures the guard time for the ring. Valid values are between 100 and 2000 (ms), Default is500ms.
- **Work Mode** : Select the reversion mode or not.
  - **Revertive** : Enables and select the reversion mode.

<b>Note</b>	After learning of the ring network fault restored, the RPL owner node will restore the blockade status of RPL and make the network flow transmission path restore to the link before the fault
-------------	--

- **Non\_revertive** : Disable and select the reversion mode.

<b>Note</b>	After learning of the ring network fault restored, the RPL owner node will not block the RPL, the network flow transmission path is same as before.
-------------	---

- **Ring ID** : ERPS ring ID, Configures the ring. Valid value are from 1 to 239 Ring ID distinguishes different Ring topology.
- **Ring Type** : Configures the Ring Type value to "0" for Master-ring or "1" for Sub-ring, Default is 0.

<b>Note</b>	Master-ring (if the value is set to "1") : It is the ring which connects the two ports on the interconnection node. Sub-ring (if the value is set to "0") : It is the ring which connects to other network through two interconnection nodes,it is not a ring network, it will make up a ring network only when connect it through the interconnection node.
-------------	--

- **Port0** : ERPS ring port 0, it could be map to real switch port1 (GE1) – port 24(GE24)

<b>Note</b>	Do not set the same as Ring port1.
-------------	------------------------------------

- **Port0 Role** : Set the ERPS port0 role as Normal or Owner, Neighbour or Next-Neighbour.
  - **Normal**: Besides Owner and Neighbor node, the rest of nodes are defined as This Normal node..
  - **Owner** : In charge of blocking one side of RPL link. It will prevent the packet flow from its blocked port.
  - **Neighbour**: In charge of blocking one side of RPL link. It will prevent the packet flow from its blocked port.
  - **Next-Neighbour**: In charge next of blocking one side of RPL link. It will prevent the packet flow from its blocked port.

- **Port1**: ERPS ring port 1, it could be map to real switch port1 (GE1) – port 24(GE24).

<b>Note</b>	Do not set the same as Ring port0.
-------------	------------------------------------

- **Port1 Role** : Set the ERPS port1 role as Normal or Owner, Neighbour or Next-Neighbour..
  - **Normal**: Besides Owner and Neighbor node, the rest of nodes are defined as This Normal node..
  - **Owner** : In charge of blocking one side of RPL link. It will prevent the packet flow from its blocked port.
  - **Neighbour**: In charge of blocking one side of RPL link. It will prevent the packet flow from its blocked port.
  - **Next-Neighbour**: In charge next of blocking one side of RPL link. It will prevent the packet flow from its blocked port

<b>Note</b>	Do not connect all switches to form a loop (ring) network until you have enabled any ERPS protocol on any ring node. There should be at least one ring port unplugged until all nodes in the topology are ready.
-------------	--

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 10. Discovery(LLDP)

The Link Layer Discovery Protocol (LLDP) is a vendor-neutral link layer protocol in the Internet Protocol Suite used by network devices for advertising their identity, capabilities, and neighbors on an IEEE 802 local area network, principally wired Ethernet.

LLDP information is sent by devices from each of their interfaces at a fixed interval, in the form of an Ethernet frame. Each frame contains one LLDP Data Unit (LLDPDU). Each LLDPDU is a sequence of type-length-value (TLV) structures.

### 10.1 Property

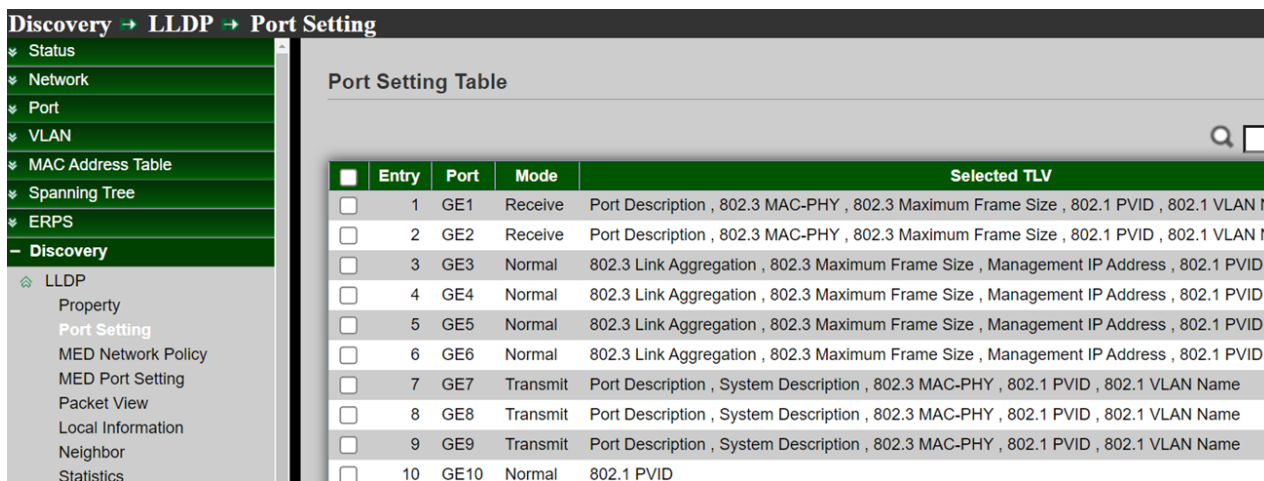

- **State:** Administrator can choose Enable or disable this LLDP function.
- **LLDP Handling:** If cancel checkbox then administrator can choose Filtering / Bridging / Flooding for LLDP handling. Select LLDP PDU handling action to be filtered, bridging or flooded when LLDP is globally disabled
  - **Filtering:** Deletes the packet.
  - **Bridging:** (VLAN-aware flooding) Forwards the packet to all VLAN members.
  - **Flooding:** Forwards the packet to all ports
- **TLV Advertise Interval:** Select the interval at which frames are transmitted. (range 5-32760, default is 30)
- **Hold Multiplier:** Set Hold value (Range 2-10, default is 4). Administrator can control the aging time of local information on the neighbor device by configuring the value of the Hold multiplier.  
 $TTL = \text{Hold multiplier} * \text{TLV Advertise Interval}$

- **Reinitializing Delay:** S Select the delay before a re-initialization (range 1–10 seconds, default = 2)..
- **Transmit Delay:** Select the delay after an LLDP frame is sent (range 1–8191 seconds, default = 3).
- **Fast Start Repeat Count:** The fast start repeat count when port link up(range 1–10,default = 3).

Click the **“Apply”** button to save your changes settings.

## 10.2 Port Setting

Administrator can configure each port of the LLDPDU Transmit / Receive / Normal or Disable the mode and choose from "Optional TLV" list send the TLV type of port.

Entry	Port	Mode	Selected TLV
1	GE1	Receive	Port Description , 802.3 MAC-PHY , 802.3 Maximum Frame Size , 802.1 PVID , 802.1 VLAN N
2	GE2	Receive	Port Description , 802.3 MAC-PHY , 802.3 Maximum Frame Size , 802.1 PVID , 802.1 VLAN N
3	GE3	Normal	802.3 Link Aggregation , 802.3 Maximum Frame Size , Management IP Address , 802.1 PVID ,
4	GE4	Normal	802.3 Link Aggregation , 802.3 Maximum Frame Size , Management IP Address , 802.1 PVID ,
5	GE5	Normal	802.3 Link Aggregation , 802.3 Maximum Frame Size , Management IP Address , 802.1 PVID ,
6	GE6	Normal	802.3 Link Aggregation , 802.3 Maximum Frame Size , Management IP Address , 802.1 PVID ,
7	GE7	Transmit	Port Description , System Description , 802.3 MAC-PHY , 802.1 PVID , 802.1 VLAN Name
8	GE8	Transmit	Port Description , System Description , 802.3 MAC-PHY , 802.1 PVID , 802.1 VLAN Name
9	GE9	Transmit	Port Description , System Description , 802.3 MAC-PHY , 802.1 PVID , 802.1 VLAN Name
10	GE10	Normal	802.1 PVID

Field	Description
Port	Display the port of LLDP state.
Mode	Display the Transmit (TX Only),Receive (RX Only),Normal (TX And RX),Disable
Selected TLV	Display the TLVs for your selected.

- **Mode** : Administrator can choose Transmit(TX) / Receive(RX) or Normal(TX+RX) and Disable, if choose disable will don't send and receive LLDPDU.
  - Transmit (TX Only): Transmit LLDP PDUs only.
  - Receive (RX Only): Receive LLDP PDUs only.
  - Normal (TX And RX): Transmit and receive LLDP PDUs both
  - Disable : Disable the transmission of LLDP PDUs
- **Optional TLV** : Administrator can be configuration information into different TLV, encapsulates LLDPDU and issued to the neighbor device.
  - System Name
  - Port Description
  - System Description
  - System Capability
  - 802.3 MAC-PHY
  - 802.3 Link Aggregation
  - 802.3 Maximum Frame Size
  - Management Address
  - 802.1 PVID
- **802.1 VLAN Name** : Select the VLAN Name ID to be carried (multiple selection is allowed).

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 10.3 MED Network Policy

Administrator can see the display for LLDP MED Network Policy Setting, Setting “add” and “Edit” and “Delete” function for this management.

**Discovery -> LLDP -> MED Network Policy**

**MED Network Policy Table**

Showing  entries      Showing 1 to 2 of 2 entries

## Device Summary

Field	Description
<b>Chassis ID Subtype</b>	Type of chassis ID, such as the MAC address.
<b>Chassis ID</b>	Identifier of chassis. Where the chassis ID subtype is a MAC address, the MAC address of the switch is displayed.
<b>System Name</b>	Name of switch.
<b>System Description</b>	Description of the switch.
<b>Supported Capabilities</b>	Primary functions of the device, such as Bridge, WLAN AP, or Router.
<b>Enabled Capabilities</b>	Primary enabled functions of the device.
<b>Port ID Subtype</b>	Type of the port identifier that is shown.

## Port Status Table

Field	Description
<b>Port</b>	Type of the port number
<b>LLDP Status</b>	LLDP Tx and Rx abilities.
<b>LLDP Med Status</b>	LLDP MED enable state.

Click **“detail”** button on the page to view detail information of the selected port.

## Local Information Detail

<b>Chassis ID Subtype</b>	MAC address
<b>Chassis ID</b>	8C:4D:EA:02:D8:64
<b>System Name</b>	Switch
<b>System Description</b>	CS-34816XG
<b>Supported Capabilities</b>	Bridge, Router
<b>Enabled Capabilities</b>	Bridge, Router
<b>Port ID</b>	GE1
<b>Port ID Subtype</b>	Local
<b>Port Description</b>	

### Management Address Table

Address Subtype	Address	Interface Subtype	Interface Number
-----------------	---------	-------------------	------------------

0 results found.

## Management Address Table

Field	Description
<b>Address Subtype</b>	Type of the port number
<b>Address</b>	Display management IP address type.
<b>Interface Subtype</b>	Returned address most appropriate for management use, typically a Layer 3 address.
<b>Interface number</b>	Specific interface associated with this management address.

## MAC/PHY Details

MAC/PHY Detail	
<b>Auto-Negotiation Supported</b>	N/A
<b>Auto-Negotiation Enabled</b>	N/A
<b>Auto-Negotiation Advertised Capabilities</b>	N/A
<b>Operational MAU Type</b>	N/A

Field	Description
<b>Auto-Negotiation Supported</b>	Port speed auto-negotiation support status.
<b>Auto-Negotiation Enabled</b>	Port speed auto-negotiation active status.
<b>Auto-Negotiation Advertised Capabilities</b>	Port speed auto-negotiation capabilities, for example, 1000BASE-T half-duplex mode, 100BASE-TX full-duplex mode.
<b>Operational MAU Type</b>	Medium Attachment Unit (MAU) type. The MAU performs physical layer functions, including digital data conversion from the Ethernet interfaces' collision detection and bit injection into the network, for example, 100BASE-TX full duplex mode.

### 802.3 Detail

802.3 Detail	
802.3 Maximum Frame Size	1522

Field	Description
<b>802.3 Maximum Frame Size</b>	The maximum supported IEEE 802.3 frame size.

### 802.3 Link Aggregation

802.3 Link Aggregation	
Aggregation Capability	N/A
Aggregation Status	N/A
Aggregation Port ID	N/A

Field	Description
<b>Aggregation Capability</b>	Indicates whether the interface can be aggregated.
<b>Aggregation Status</b>	Indicates whether the interface is aggregated.
<b>Aggregation Port ID</b>	Advertised aggregated interface ID.

### Global Statistics

Field	Description
<b>Insertions</b>	The number of times the complete set of information advertised by a particular MAC Service Access Point (MSAP) has been inserted into tables associated with the remote systems.
<b>Deletions</b>	The number of times the complete set of information advertised by MSAP has been deleted from tables associated with the remote systems.
<b>Drops</b>	The number of times the complete set of information advertised by MSAP could not be entered into tables associated with the remote systems because of insufficient resources.
<b>Age Outs</b>	The number of times the complete set of information advertised by MSAP has been deleted from tables associated with the remote systems because the information timeliness interval has expired.

Click the **“Clear”** button to clear this page or click the **“Refresh”** button to refresh the page .

## Statistics Table

Field	Description
<b>Port</b>	Interface or port number.
<b>Transmit Frame Total</b>	Number of LLDP frames transmitted on the corresponding port.
<b>Receive Frame</b>	<ul style="list-style-type: none"> <li>● <b>Total:</b> Number of LLDP frames received by this LLDP agent on the corresponding port, while the LLDP agent is enabled</li> <li>● <b>Discarded:</b> Number of LLDP frames discarded for any reason by the LLDP agent on the corresponding port.</li> <li>● <b>Errors:</b> Number of invalid LLDP frames received by the LLDP agent on the corresponding port, while the LLDP agent is enabled.</li> </ul>
<b>Receive TLV</b>	<ul style="list-style-type: none"> <li>● <b>Discarded:</b> Number of TLVs of LLDP frames discarded for any reason by the LLDP agent on the corresponding port.</li> <li>● <b>Unrecognized:</b> Number of TLVs of LLDP frames that are unrecognized while the LLDP agent is enabled</li> <li>● <b>Neighbor Timeout:</b> Number of TLVs of LLDP frames that are unrecognized while the LLDP agent is enabled</li> </ul>
<b>Neighbor Timeout</b>	Number of age out LLDP frames.

## 11. DHCP

The protocol operates on a client-server model. When DHCP clients connect to the network, they send broadcast queries to request the necessary information from the DHCP server. A DHCP server manages a pool of IP addresses and network configuration information. If they receive a query from a DHCP client, they will automatically be assigned an IP address and network parameters.

Dynamic Host Configuration Protocol (DHCP) is a standardized network protocol. It is used in Internet Protocol (IP) networks to dynamically distribute network configuration parameters. For example, a device can request an IP address for an interface from a DHCP server. Using DHCP also reduces the need for network administrators or users to manually configure these settings.

### 11.1 Property

Administrator can configure this “DHCP port Setting Table” for Enable / Disable DHCP Server function.

Entry	Port	State
1	GE1	Enabled
2	GE2	Enabled
3	GE3	Enabled
4	GE4	Disabled
5	GE5	Disabled

Use this section to enable the DHCP Server function on the switch. Also can select DHCP "Static Binding First" function to ticking “enable” for your configuration.

*Click the “Apply” button to save your changes settings.*

Field	Description
Port	Display the DHCP of port entry.
State	Show the DHCP Enable or DHCP Display Status.

## Edit Port Setting :

You can select the port form GE1 - GE28 (Ports) and LAG1~LAG8 (Groups) to be set, and click "Edit" to edit DHCP port to ticking "enable" for your configuration.

### Edit Port Setting

---

Port	GE12
State	<input checked="" type="checkbox"/> Enable

Click the **"Apply"** button to save your changes or **"Close"** the button to close settings.

## 11.2 IP Pool Setting

Administrator can configure this IP Pool Table Setting **"add"** and **"Edit"** and **"Delete"** function management.

- **Pool** : Select Add New Pool and enter a name for the DHCP Pool.
- **Gateway** : Enter the IP address of the gateway, which is the host on the LAN that relays all traffic coming into and going out of the LAN.
- **Mask** : Assign the subnet mask of IP address.
- **IP Address Section** :
  - **Section** : Select the Section number.
  - **Start Address** : Enter the starting point for the DHCP server to assign IP address for the device connected.
  - **End Address** : Enter the ending point for the DHCP server to assign IP address for the device connected.
- **DNS Primary Server** : Select “enable” and fill in the for your primary DNS IP address.
- **DNS Second Server** : Select “enable” and fill in the for your second DNS IP address.
- **Option 43** : Configure option 43 character string with “ASCII” format and configure option 43 character string with “HEX” format in IP DHCP pool mode.
- **Lease time** : A controllable time period that DHCP server will reclaim IP addresses, Set the time value if set time is selected as Day / Hour / Minute.

Click the “**Apply**” button to save your changes or “**Close**” the button to close settings.

## 11.3 VLAN IF Address Group Setting

Administrator can configure select the drop down list of "VLAN Interface" and ""DHCP server group " in the VLAN interface address pool table".

- **Interface** : Select a VLAN interface.
- **DHCP Sever Group** : Select a DHCP Sever Group.

Click the **“Apply”** button to save your changes settings.

Administrator can configure this “DHCP Server Group Table” page setting for **“add”** and **“Edit”** and **“Delete”** function management.

Field	Description
<b>Group ID</b>	Displays the DHCP Server Group ID
<b>Group IP Address</b>	Displays the DHCP Server Group IP Address
<b>Bind VLAN Interface</b>	Displays the DHCP Server Bind VLAN Interface

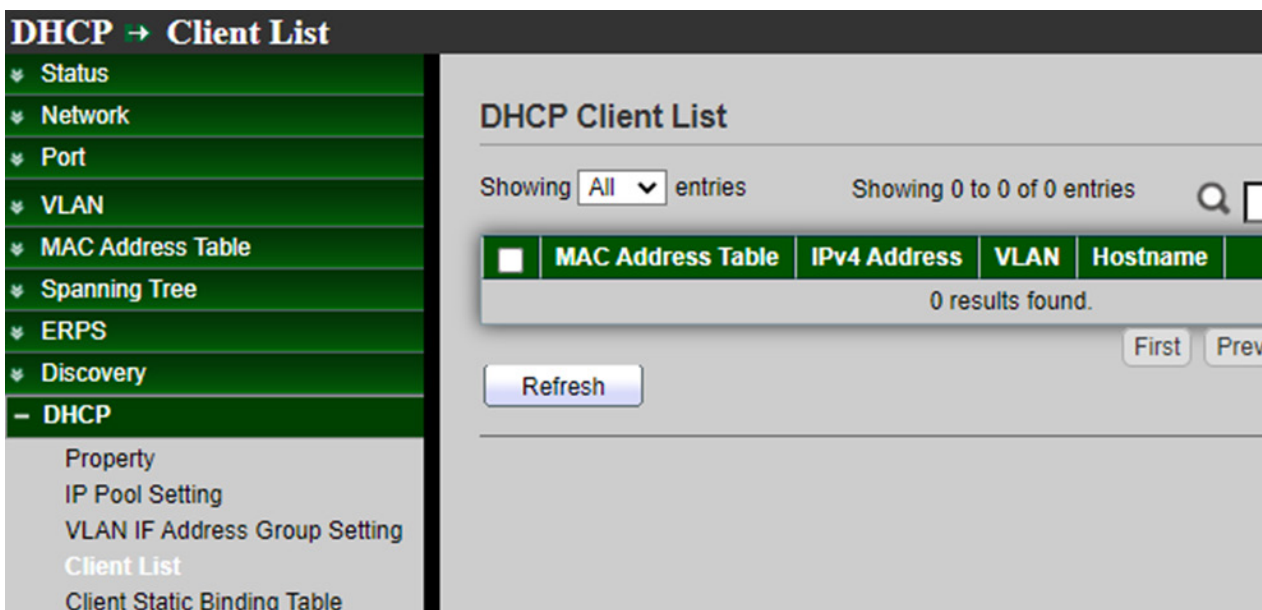

- **DHCP Server Group** : Administrator can be select “DHCP Server Group in the drop-down box, and then confirm the grouping function to be set.
- **Group IP Address** : Administrator can fill in Group IP address.

Click the “**Apply**” button to save your changes or “**Close**” the button to close settings.

## 11.4 Client List

This page can displayed DHCP Client List show” MAC Address Table” and show “IPv4 Address” and show “VLAN” and show “Hostname” information .

Field	Description
<b>MAC Address Table</b>	Display the MAC address of the client device.
<b>IPv4 Address</b>	Display the IP address sent to the client device.
<b>VLAN</b>	Display the VLAN ID of the DHCP client.
<b>Hostname</b>	Displays the hostname of the DHCP client.

Click “**Refresh**” to refresh the “Client List” statistics .

## 11.5 Client Static Binding Table

Administrator can configure this “Static Binding Table” setting for “add” and “Delete” function management. And this page can displayed “Static Binding Table” show “MAC Address Table” and show “IPv4 Address” and show “VLAN” and show “User Name” information .

Field	Description
MAC Address Table	Display the MAC address of the client device.
IPv4 Address	Display the IP address sent to the client device.
VLAN	Display the VLAN ID of the DHCP client.
Users Name	Displays the Users Name of the DHCP client.

- **MAC Address** : The MAC address of the device that wishes binding.

- **VLAN** : Administrator can be configuration the DHCP VLAN ID.
- **IPv4 Address** : The IP address that will assign to the device with Binding MAC address.
- **User Name** : Generates a username for this binding rule.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

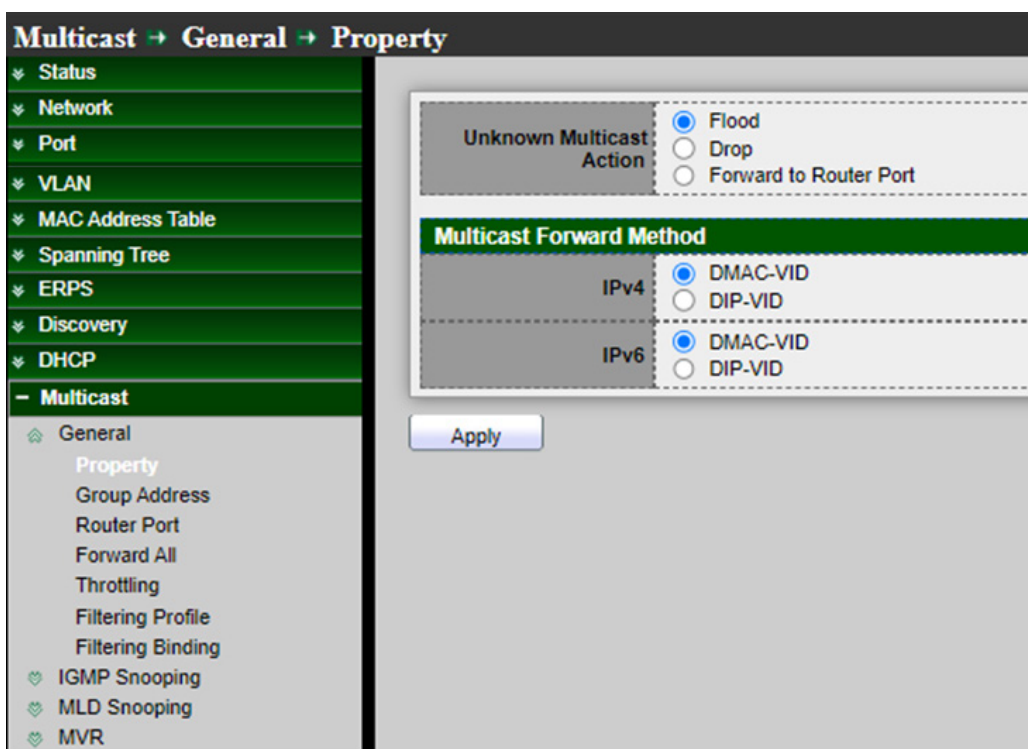

## 12. Multicast

Multicast is the only type of IPv4 multicast that is supported by the Ethernet gateway.

### 12.1 General

#### 12.1.1 Property

This page can be configured with unknown multicast action, administrator can set the forwarding method is based on the DMAC or the DIP, the function implements high performance data transfer from point to multipoint in network will be reduce the loading on the network.

- **Unknown Multicast Action** : Set the unknown multicast action
  - **Drop**: drop the unknown multicast data.
  - **Flood**: flood the unknown multicast data.
  - **Router port**: forward the unknown multicast data to router port.
- **Multicast Forward Method** : Assign the subnet mask of IP address.
- **IPV4** : Set the ipv4 multicast forward method.

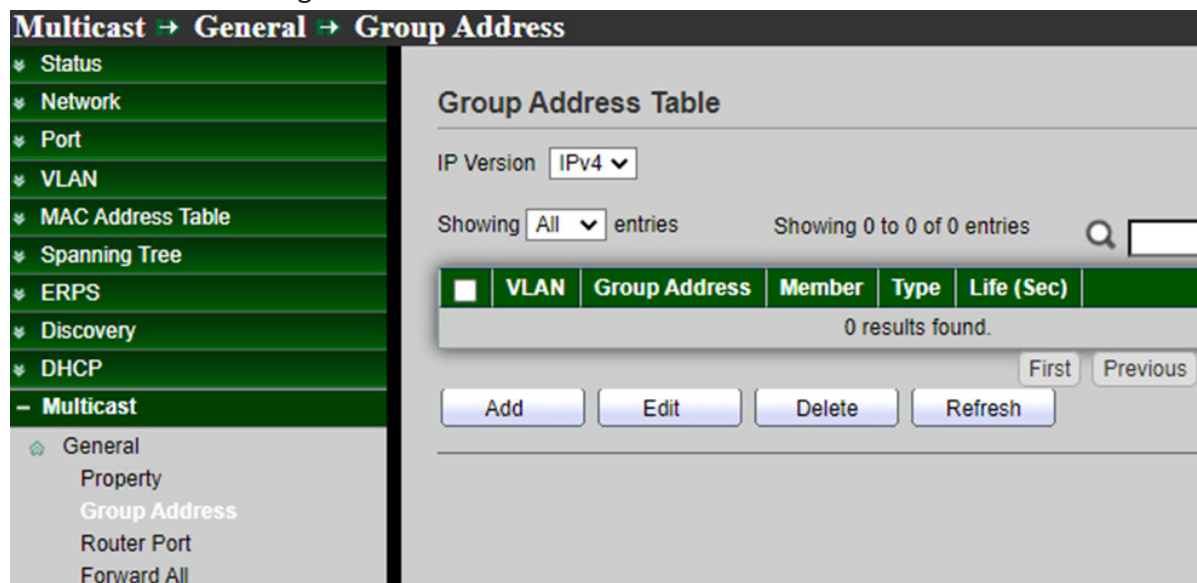

- **MAC-VID** : forward method dmac+vid.
- **DIP-VID** : forward method dip+vid.
- **IPV6** : Set the ipv6 multicast forward method.
  - **MAC-VID** : forward method dmac+vid.
  - **DIP-VID** : forward method dip+vid(dip is ipv6 low 32 bit).

Click the **“Apply”** button to save your changes settings.

## 12.1.2 Group Address

The multicast address range is 224.0.0.0 to 239.255.255.255 and forms the Class D range which is made up of the high order bits 1110 followed by the 28 bit multicast group ID. There is no subletting with these Class D addresses. A multicast group can have a permanently-assigned address or the group may be Transient, , Setting **“add”** and **“Edit”** and **“Delete”** and **“Refresh”** function for this management.

- **IPV4 Version** : Select the IP Version.
  - **IPv4** : ipv4 multicast group.
  - **IPv6** : ipv6 multicast group.

Field	Description
<b>VLAN</b>	The VLAN ID of group.
<b>Group Address</b>	The group IP address.

<b>Member</b>	The member ports of group.
<b>Type</b>	The type of group. Static or Dynamic.
<b>Life(Sec)</b>	The life time of this dynamic group.

**Add Group Address**

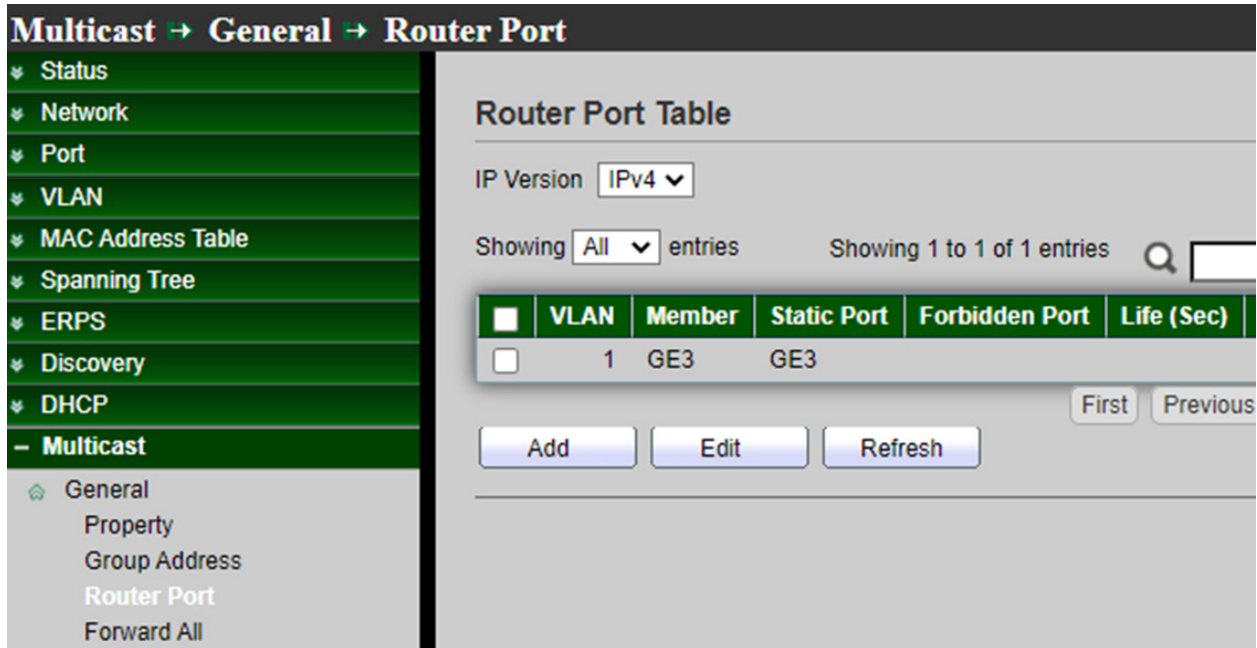

<b>VLAN</b>	1 ▾	
<b>IP Version</b>	IPv4 ▾	
<b>Group Address</b>	<input type="text"/>	
<b>Member</b>	<b>Available Port</b>	<b>Selected Port</b>
	<div style="border: 1px solid #ccc; padding: 5px;">                 GE1 GE2 GE3 GE4 GE5 GE6 GE7 GE8             </div>	<div style="border: 1px solid #ccc; padding: 5px; width: 100px;">                 [Empty]             </div>
<input type="button" value="Apply"/> <input type="button" value="Close"/>		

- **VLAN** : The VLAN ID of group.
- **IP Version** :
  - **IPv4** : ipv4 multicast group.
  - **IPv6** : ipv6 multicast group.
- **Group Address** : The group IP address.
- **Member** : The member ports of group.
  - **Available Port**: Optional port member.
  - **Selected Port**: Selected port member.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 12.1.3 Router Port

A Multicast Router (MRouter) port is a port that connects to a Multicast router. The switch includes the MRouter port(s) when it forwards Multicast streams and IGMP/ MLD registration messages. It is required in order for all Router(s) can, in turn; forward the Multicast streams and propagate the registration messages to other subnets, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

- **IPv4 Version** : Select the IP Version.
  - **IPv4** : ipv4 multicast router.
  - **IPv6** : ipv6 multicast router.

Field	Description
<b>VLAN</b>	The VLAN ID router entry.
<b>Member</b>	Router Port member (include static and learned port member).
<b>Static Port</b>	Static router port member.
<b>Forbidden Port</b>	Forbidden router port member.
<b>Life(Sec)</b>	The expiry time of the router entry.

### Add Router Port

<b>VLAN</b>	Available VLAN <input type="text" value="1"/>	<input type="button" value="➤"/>  <input type="button" value="➤"/>	Selected VLAN <input type="text"/>
<b>IP Version</b>	<input type="text" value="IPv4"/>		
<b>Type</b>	<input checked="" type="radio"/> Static <input type="radio"/> Forbidden		
<b>Port</b>	Available Port <input type="text" value="GE1"/> <input type="text" value="GE2"/> <input type="text" value="GE3"/> <input type="text" value="GE4"/> <input type="text" value="GE5"/> <input type="text" value="GE6"/> <input type="text" value="GE7"/> <input type="text" value="GE8"/>	<input type="button" value="➤"/>  <input type="button" value="➤"/>	Selected Port <input type="text"/>

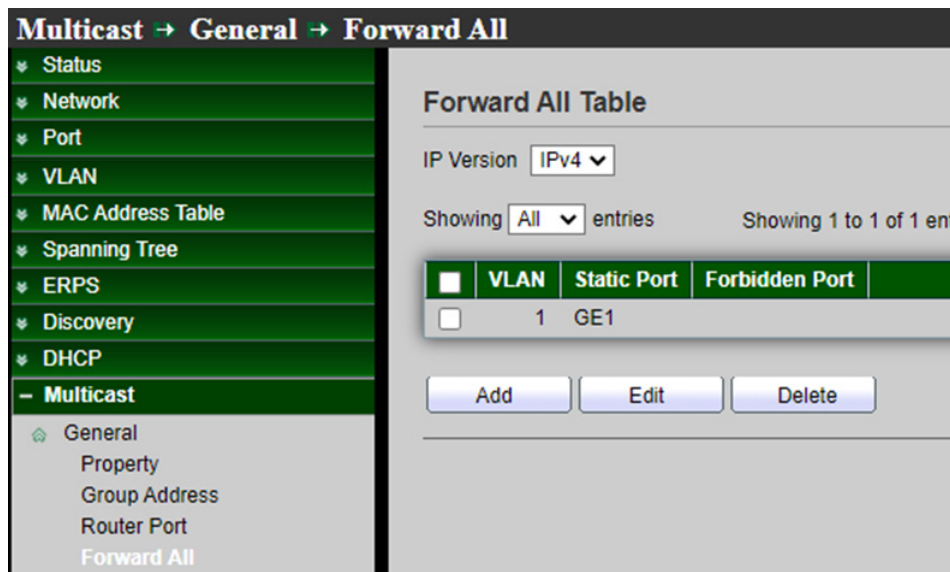

- **VLAN** : The VLAN ID of group.
  - **Available VLAN**: Optional VLAN member.
  - **Selected VLAN**: Selected VLAN member.
- **IP Version** :
  - **IPv4** : IPv4 multicast router.
  - **IPv6** : IPv6 multicast router.
- Type** : The router port type:
  - **Static** : Static router port.
  - **Forbidden** : forbidden router port, can't learn dynamic router port member.
- **Port** : The member ports of Router entry.
  - **Available Port**: Optional router port member.
  - **Selected Port**: Selected router port member.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 12.1.4 Forward All

Configure ports or LAGs to receive Multicast streams from a specific VLAN. Administrator can statically configure a port to Forward All if the devices connecting to the port do not support IGMP or MLD, Setting “add” and “Edit” and “Delete” function for this management.

**Note** The configuration affects only the ports that are members of the selected VLAN.

- **IPv4 Version** : Select the IP Version.
  - **IPv4** : IPv4 multicast forward all.
  - **IPv6** : IPv6 multicast forward all.

Field	Description
VLAN	VLAN ID of forward all entry
Static Port	Known multicast group always forward port member
Forbidden Port	Known multicast group always not forward port member

### Add Forward All

<b>VLAN</b>	<p style="text-align: center;">Available VLAN</p> <div style="border: 1px solid #ccc; height: 40px; width: 100%;"></div>	<p style="font-size: 20px;">➤</p> <p style="font-size: 20px;">➤</p>	<p style="text-align: center;">Selected VLAN</p> <div style="border: 1px solid #ccc; height: 40px; width: 100%; text-align: center;">1</div>
<b>IP Version</b>	<div style="border: 1px solid #ccc; padding: 2px;">IPv4 ▼</div>		
<b>Type</b>	<p><input checked="" type="radio"/> Static</p> <p><input type="radio"/> Forbidden</p>		
<b>Port</b>	<p style="text-align: center;">Available Port</p> <div style="border: 1px solid #ccc; padding: 2px;">           GE2 GE3 GE4 GE5 GE6 GE7 GE8 GE9         </div>	<p style="font-size: 20px;">➤</p> <p style="font-size: 20px;">➤</p>	<p style="text-align: center;">Selected Port</p> <div style="border: 1px solid #ccc; height: 40px; width: 100%; text-align: center;">GE1</div>

Apply
Close

- **VLAN** : The VLAN ID of forward all entry.
  - **Available VLAN**: Optional VLAN member.
  - **Selected VLAN**: Selected VLAN member.
- **IP Version** :
  - **IPv4** : IPv4 multicast forward all.
  - **IPv6** : IPv6 multicast forward all.
- **Type** : The forward all port type
  - **Static** : Static forward all port. The port is statically configured as a Multicast router port.
  - **Forbidden** : Forbidden forward all port. This port is not to be configured as a Multicast Router port, even if IGMP or MLD queries are received on this port.
- **Port** : The member ports of forward all.
  - **Available Port**: Optional router port member.
  - **Selected Port**: Selected router port member.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 12.1.5 Throttling

This page allow user to configure port can learned max group number and if port group number arrived max group number action.

<input type="checkbox"/>	Entry	Port	Max Group	Exceed Action
<input type="checkbox"/>	1	GE1	256	Deny
<input type="checkbox"/>	2	GE2	256	Deny
<input type="checkbox"/>	3	GE3	256	Deny
<input type="checkbox"/>	4	GE4	256	Deny
<input type="checkbox"/>	5	GE5	256	Deny
<input type="checkbox"/>	6	GE6	256	Deny
<input type="checkbox"/>	7	GE7	256	Deny
<input type="checkbox"/>	8	GE8	256	Deny

- **IPV4 Version** : Select the IP Version.
  - **IPv4** : IPv4 for IGMP snooping throttling.
  - **IPv6** : IPv6 for MLD snooping throttling.

Field	Description
Port	Display the Port Name
Max Group	Display the Max number of group for port
Exceed Action	Display the port exceed max number group learning group action

- **Port** : Display the selected port list.

- **IP Version** : Display the selected IP version
- **Max Group** : Max number of group for port
- **Exceed Action** : Excess Max number of port learning group action.
  - **Deny**: do not learning group.
  - **Replace**: random replace one exist group.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 12.1.6 Filtering Profile

Filter profile permits or denies a range of Multicast groups to be learned when the join group matches the filter profile IP group range, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

- **IPV4 Version** : Select the IP Version.
  - **IPv4** : IPv4 for IGMP snooping profile.
  - **IPv6** : IPv6 for MLD snooping profile.

Field	Description
Profile ID	Display profile ID
Start Address	The start group address of profile
End Address	The end group address of profile

---

## Action Display profile action

---

**Add Profile**

Profile ID	<input type="text" value=""/> (1 - 128)
IP Version	<input type="button" value="IPv4"/> ▾
Start Address	<input type="text" value=""/>
End Address	<input type="text" value=""/>
Action	<input checked="" type="radio"/> Allow <input type="radio"/> Deny

- **Profile ID: Profile ID.**
- **IP Version :** Display the selected IP version
  - **IPv4:** IGMP snooping profile.
  - **IPv6:** MLD snooping profile.
- **Start Address:** The start group address of profile.
- **End Address :** The end group address of profile.
- **Action:** The action of profile:
  - **Allow:** permit all packets that match the profile.
  - **Deny:** deny all packets that match the profile.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 12.1.7 Filtering Binding

When the setting is completed of Filtering Profile, administrator can select ports to set filtering binding.

**Multicast → General → Filtering Binding**

- ⌵ Status
- ⌵ Network
- ⌵ Port
- ⌵ VLAN
- ⌵ MAC Address Table

	<input type="text" value=""/>

Apply Close

- **Port**: Selected Port List.
- **IP Version** : Display Selected Port filtering IP version.
- **Profile ID**: If check Enable, can select or change profile ID, Else it will delete port filter profile binding.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 12.2 IGMP Snooping

IGMP snooping is the process of listening to Internet Group Management Protocol (IGMP) network traffic. The feature allows a network switch to listen in on the IGMP conversation between hosts and routers. By listening to these conversations the switch maintains a map of which links need which IP multicast streams. Multicasts may be filtered from the links which do not need them and thus controls which ports receive specific multicast traffic. The IGMP snooping support v2 & v3, administrator can forward or drop Unknown Multicast.

### 12.2.1 Property

When IGMP Snooping is enabled globally or on a VLAN, all IGMP packets are forwarded to the CPU. The CPU analyzes select of ports are asking to join Multicast groups on VLAN or routers that are generating IGMP queries, or receiving PIM / OSFP / DVMRP / IGMP query protocols incoming packets.

VLAN	Operational Status	Router Port Auto Learn	Query Robustness	Query Interval	Query Max Response Interval	Last Member Query Count
1	Disabled	Enabled	2	125	10	

- **State:** Administrator can select Enable or Un-enable, Set the enabling status of IGMP Snooping functionality.
  - **Enable:** If Checked Enable IGMP Snooping, else is Disabled IGMP Snooping.
- **Version:** Select either IGMPv2 or IGMPv3, Set the igmp snooping version.
  - **IGMPv2:** Only support process igmp v2 packet.
  - **IGMPv3:** Support v3 basic and v2.
- **Report Suppression:** Enable or disable IGMP report suppression. If administrator select disabling this feature will forward all IGMP reports to Multicast routers, Set the enabling status of IGMP v2 report suppression.
  - **Enable:** If Checked Enable IGMP Snooping v2 report suppression, else Disable the report

suppression function.

Click the **“Apply”** button to save your changes.

VLAN Setting Table

<input type="checkbox"/>	VLAN	Operational Status	Router Port Auto Learn	Query Robustness	Query Interval	Query Max Response Interval	Last Member Query Counter	Last Member Query Interval	Immediate Leave

Apply Close

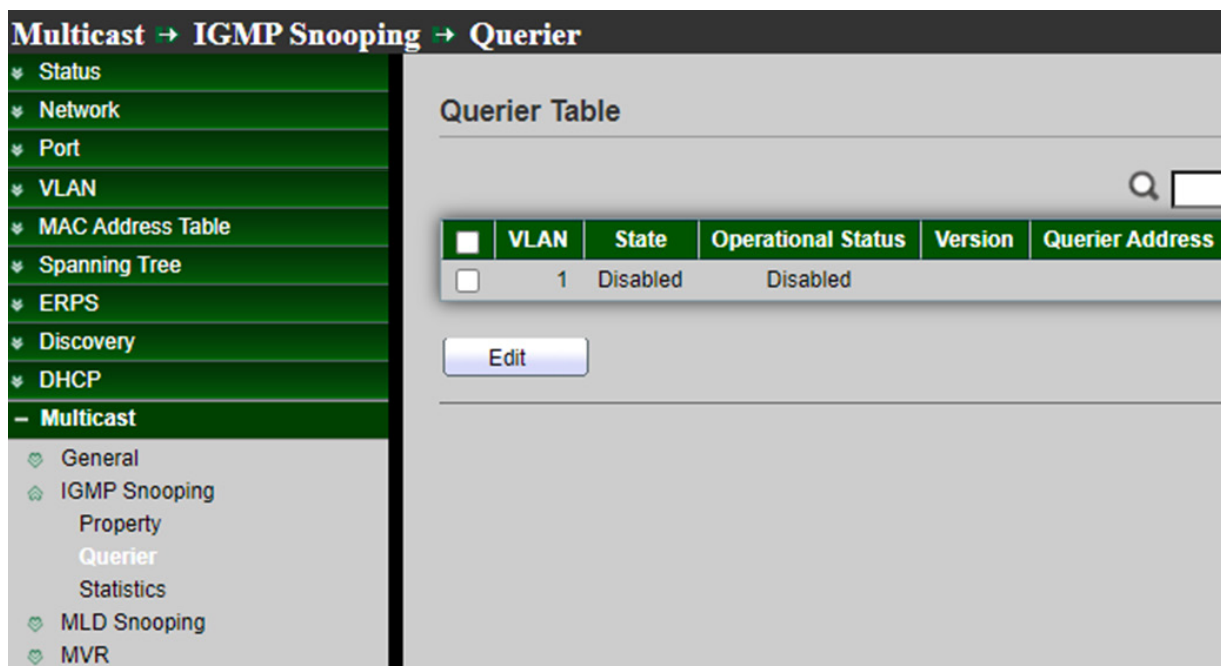

- **VLAN:** The VLAN ID of IGMP Snooping.
- **State:** Set the enabling status of IGMP Snooping VLAN functionality.
  - **Enable: Enable:** If Checked Enable IGMP Snooping VLAN, else is Disabled IGMP Snooping VLAN.
- **Router Port Auto Learn:** Set the enabling status of IGMP Snooping router port learning.
  - **Enable:** If checked Enable learning router port by query and PIM, DVRMP, else Disable the learning router port.
- **Immediate leave:** Immediate Leave the group when receive IGMP Leave message.
  - **Enable:** If checked Enable immediate leave, else disable immediate leave.
- **Query Robustness:** The Admin Query Robustness allows tuning for the expected packet loss on a subnet.
- **Query Interval:** The Admin interval of querier to send general query.
- **Query Max Response Interval:** The Admin query max response interval, In Membership Query Messages, it specifies the maximum allowed time before sending a responding report in units of 1/10 second.
- **Last Member Query Counter:** The Admin last member query count that Querier-switch sends Group-Specific Queries when it receives a Leave Group message for a group.
- **Last Member Query Interval:** The Admin last member query interval that Querier-switch sends Group-Specific Queries when it receives a Leave Group message for a group.

- **Operational Status:** Set the enabling status of IGMP Snooping router port learning.
  - **Status:** Operational IGMP snooping status, must both IGMP snooping global and IGMP snooping enable the status will be enable.
  - **Query Robustness:** Operational Query Robustness.
  - **Query Interval:** Operational Query Interval.
  - **Query Max Response Interval:** Operational Query Max Response Interval.
  - **Last Member Query Counter:** Operational Last Member Query Count.
  - **Last Member Query Interval:** Operational Last Member Query Interval.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 12.2.2 Querier

Administrator can choose created VLAN to enable or disable the IGMP Snooping query function. When select checkbox and click **“Edit”** button will be go to set IGMP Snooping version, this function can get IGMP Snooping query device regularly to VLAN local segments in all hosts and routers send IGMP Snooping general query packets, to the query segment which multicast group members.

Multicast → IGMP Snooping → Querier					
Querier Table					
<input type="checkbox"/>	VLAN	State	Operational Status	Version	Querier Address

## 12.3 MLD Snooping

The function support selective Multicast forwarding (IPv6), MLD Snooping must be enabled globally and for each relevant VLAN. The switch supports MLD Snooping on both static and dynamic VLANs. Hosts use the MLD protocol to report their participation in Multicast sessions, and the switch uses MLD Snooping to build Multicast membership lists. It uses these lists to forward Multicast packets only to switch ports where there are host nodes that are members of the Multicast groups. The switch does not support MLD Querier.

### 12.3.1 Property

Administrator to enable MLD Snooping in addition to the manually configured Multicast groups, the result is a union of the Multicast groups and port memberships derived from the manual setup and the dynamic discovery by MLD Snooping. However, only the static definitions are preserved when the switch is rebooted.

**Multicast → MLD Snooping → Property**

- **State:** Set the enabling status of MLD Snooping VLAN functionality.
  - **Enable: Enable:** If Checked Enable MLD Snooping VLAN, else is Disabled MLD Snooping VLAN.
- **Router Port Auto Learn:** Set the enabling status of MLD Snooping router port learning.
  - **Enable:** If checked Enable learning router port by query and PIM, DVRMP, else Disable the learning router port.
- **Immediate leave:** Immediate Leave the group when receive MLD Leave message.
  - **Enable:** If checked Enable immediate leave, else disable immediate leave.
- **Query Robustness:** The Admin Query Robustness allows tuning for the expected packet loss on a subnet.
- **Query Interval:** The Admin interval of querier to send general query.
- **Query Max Response Interval:** The Admin query max response interval, In Membership Query Messages, it specifies the maximum allowed time before sending a responding report in units of 1/10 second.
- **Last Member Query Counter:** The Admin last member query count that Querier-switch sends Group-Specific Queries when it receives a Leave Group message for a group.
- **Last Member Query Interval:** The Admin last member query interval that Querier-switch sends

Group-Specific Queries when it receives a Leave Group message for a group.

- **Operational Status:** Set the enabling status of MLD Snooping router port learning.
  - **Status:** Operational MLD snooping status, must both MLD snooping global and MLD snooping enable the status will be enable.
  - **Query Robustness:** Operational Query Robustness.
  - **Query Interval:** Operational Query Interval.
  - **Query Max Response Interval:** Operational Query Max Response Interval.
  - **Last Member Query Counter:** Operational Last Member Query Count.
  - **Last Member Query Interval:** Operational Last Member Query Interval.

### 12.3.2 Statistics

If administrator to enable MLD snooping, the page will display Receive / Transmit Packet information of MLD Snooping.

## 12.4 MVR

MVR (Multicast VLAN Registration) is designed for applications that use wide-scale deployment of multicast traffic across an Ethernet ring-based service-provider network (for example, the broadcast of multiple television channels over a service-provider network). MVR allows a subscriber on a port to subscribe and unsubscribe to a multicast stream on the network-wide multicast VLAN.

It allows the single multicast VLAN to be shared in the network while subscribers remain in separate VLANs. MVR provides the ability to continuously send multicast streams in the multicast VLAN, but to isolate the streams from the subscriber VLANs for bandwidth and security reasons.

## 12.4.1 Property

**Multicast → MVR → Property**

State	<input checked="" type="checkbox"/> Enable
VLAN	1
Mode	<input checked="" type="radio"/> Compatible <input type="radio"/> Dynamic
Group Start	0.0.0.0
Group Count	1 (1 - 128)
Query Time	1 Sec (1 - 10)
<b>Operational Group</b>	
Maximum	128
Current	0

- **State:** Administrator can select Enable or Un-enable, Set the enabling status of MVR functionality.
  - **Enable:** if checked enable the MVR state, else disable the MVR state.
- **VLAN:** Select the MVR VLAN ID.
- **Mode:** Set the MVR mode.
  - **Compatible:** compatible mode.
  - **Dynamic:** dynamic mode, will learn group member on source port.
- **Group Start:** Administrator can set range is 224.0.0.0 to 239.255.255.255, MVR group range start.
- **Group Count:** MVR group continue count, Uses the count parameter to configure a contiguous series of MVR group addresses (the range for count is 1 to 128; the default is 1).
- **Query Time:** MVR query time when receive MVR leave MVR group packet, Administrator can defines the maximum time to wait for IGMP report memberships on a receiver port before removing the port from multicast group membership. The value is in units of second. The range is 1 to 10, and the default is 1 second.
- **Operational Group:**
  - **Maximum:** The max number of MVR group database.
  - **Current:** The learned MVR group current time.

*Click the “Apply” button to save your changes settings.*

## 12.4.2 Port Setting

Administrator can select ports to set role and immediate of MVR.

## 13. IP Configuration

By default all ports belong to the same VLAN and the switch only provides Layer 2 Function. To segment connected networks, first create a VLAN for each unique network user group or application traffic, assign all ports belonging to the same group to these VLANs, and assign an IP interface to each VLAN. By dividing the network into Different VLANs, which can be divided into subnets that are disconnected at the layer2. Network traffic within the same subnet is still switched using Layer 2 switching. and VLANs can now (as required) be interconnected with Layer 3 switching. Each VLAN represents a layer 3 virtual interface. You only need to provide Network address for each virtual interface, and traffic between different interfaces Subnets will be routed through Layer 3

switching.

## 13.1 IPv4 Management and Interfaces

This chapter describes how to configure the IP interface for management access

Switch over the network. The switch supports IP version 4 and version 6,

And can be managed simultaneously by any of these address types. You can manually configure specific IPv4 or IPv6 addresses, or instruct the switch to obtain an IPv4 address from a BOOTP or DHCP server. An IPv6 address can only be configured manually.

### IPv4 Configuration – Set the IPv4 address for management access.

An IPv4 address default IP is **'192.168.2.200'** To configure a static address, To configure a static address, you need to change the switch's default settings to values that are compatible with your network. **You may also need to establish a default gateway between the switch and management stations that exist on another network segment (if no routing protocols are enabled).**

You can direct the device to obtain an address from a BOOTP or DHCP server, or manually configure a static IP address. Valid IP addresses consist of four decimal numbers, 0 to 255, separated by periods. Anything other than this format will not be accepted.

#### 13.1.1 IPv4 Interface & Default IP Configure

Administrator can configure this drop down list to specify the VLAN ID number of the IPv4 interface through which the IPv4 packets are forwarded and The Switch supports the VLAN interface type and Loopback interface type, Setting **"add"** and **"Edit"** and **"Delete"** function for this management.

- **Address Type :**
  - **Dynamic :** Select to set as "Dynamic" type.
  - **Static :** Select to set as "Static" type.

**Note** If set the “Dynamic” type , The IP settings will be obtained from other DHCP server assignments.

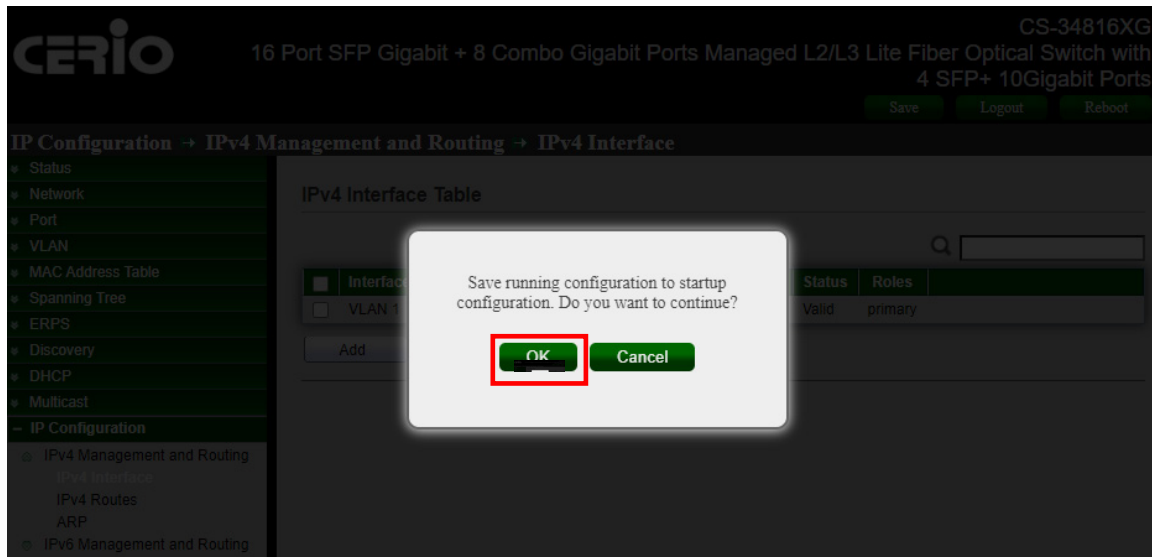

- **IP Address :** IP Address of the VLAN. Valid IP addresses consist of four numbers, 0 to 255, separated by periods. **(Default IP is : 192.168.2.200).**
- **Mask :**
  - **Network Mask :** This mask identifies the host address bits used for routing to specific subnets. **(Default Network Mask is : 255.255.255.0)**
  - **Prefix Length :** In the Prefix Length field, define the Prefix Length of the Routing IPv4 Interface.
- **Roles :**
  - **Primary :** In the Primary field, Select the setting defined as the primary roles.
  - **Sub :** In the Sub field, Select the setting defined as the secondary roles.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

**‘Save running configuration to startup configuration’**

After successfully changing the new IP, execute "Save running configuration to startup configuration" to make the new IP setting of Fiber Optical Switch take effect every time it is started.

Click the "ok" button to save 'Save running configuration to startup configuration'.

## Add New VLAN IP address setting on 'Loopback'

**Add IPv4 Interface**

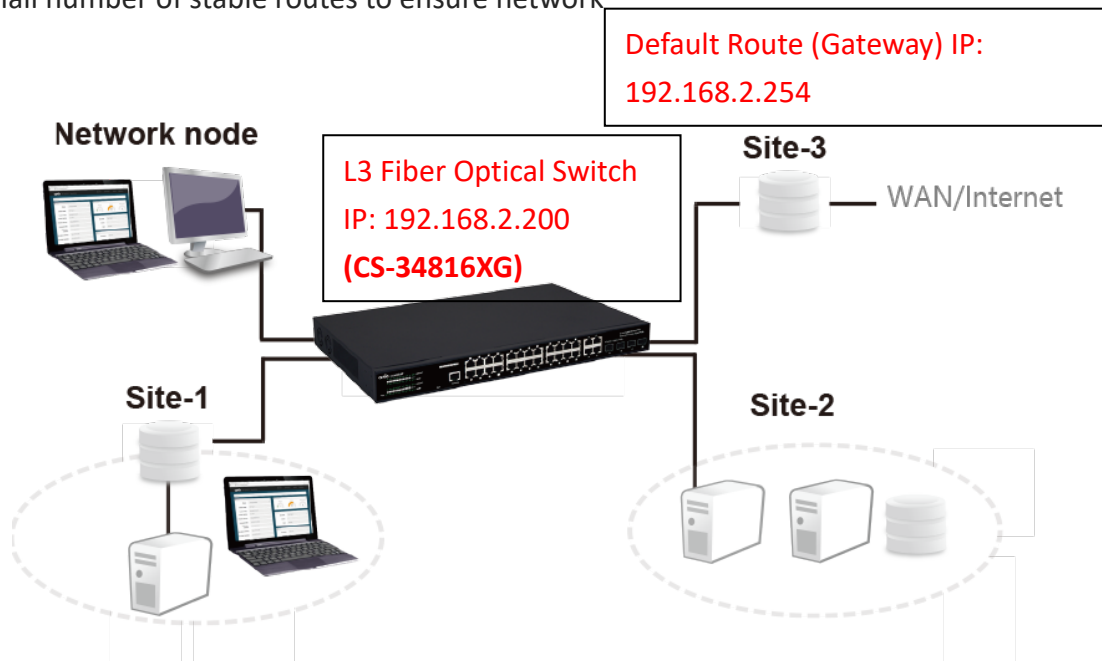

<b>Interface</b>	<input type="radio"/> VLAN <span style="border: 1px solid #ccc; padding: 2px;">1</span>
	<input checked="" type="radio"/> Loopback
<b>Address Type</b>	<input type="radio"/> Dynamic
	<input checked="" type="radio"/> Static
<b>IP Address</b>	<input style="width: 100%;" type="text" value="192.168.182.8"/>
<b>Mask</b>	<input checked="" type="radio"/> Network Mask <input style="width: 100%;" type="text" value="255.255.255.0"/>
	<input type="radio"/> Prefix Length <input style="width: 100%;" type="text" value=""/> (8 - 30)
<b>Roles</b>	<input checked="" type="radio"/> primary
	<input type="radio"/> sub

- **Address Type** : The Interface for Loopback only provides settings as "static" type.
- **IP Address** : In the IP Address field, define the IP address of the Routing IPv4 Interface.
- **Mask** :
  - **Network Mask** : In the Network Mask field, define the Subnet Mask of the Routing IPv4 Interface.
- **Prefix Length** : In the Prefix Length field, define the Prefix Length of the Routing IPv4
- **Roles** :
  - **Primary** : In the Primary field, Select the setting defined as the primary roles.
  - **Sub** : In the Sub field, Select the setting defined as the secondary roles.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 13.1.2 IPv4 Routes & Default Route Configure

You can enter static routes in the routing table using the IP > Static Routes (Add) page. Static routes may be required to force the use of a specific route to a subnet. Static routes do not automatically change in response to changes in network topology , so you should only configure a small number of stable routes to ensure network

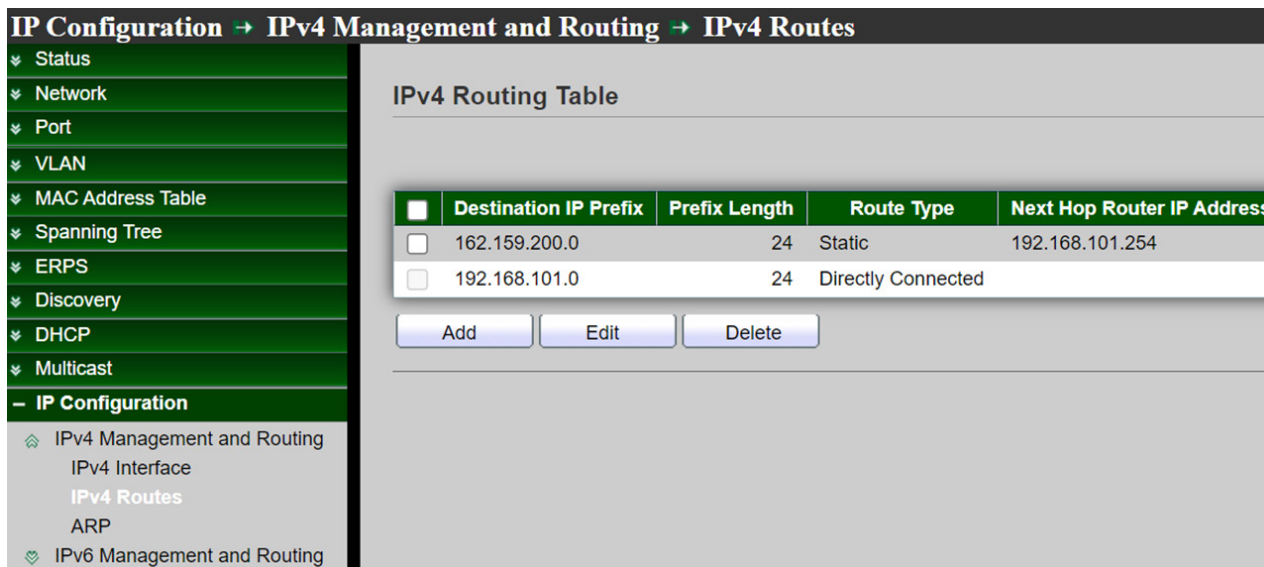

The Switch usually uses the default gateway to route outbound traffic from computers on the LAN to the Internet. In the network, the router selects an appropriate path according to the destination address of the received data, and forwards the data to the next router. The last router in the path is responsible for forwarding the packet to the destination host.

For example, the traffic from “Network node” to the Internet through the Switch’s **default Route (default Gateway) (Site-3)**. You create one static route to connect to services offered by your ISP

behind router (Site-2).

You create another static route to communicate with a separate network behind a router (Site-1) connected to the Switch.

Administrator can configure this "IPv4 Routing Table" page setting for "add" and "Edit" and "Delete" function management.

**IP Configuration → IPv4 Management and Routing → IPv4 Routes**

IPv4 Routing Table

<input type="checkbox"/>	Destination IP Prefix	Prefix Length	Route Type	Next Hop Router IP Address
<input type="checkbox"/>	162.159.200.0	24	Static	192.168.101.254
<input type="checkbox"/>	192.168.101.0	24	Directly Connected	

[Configure next hop route of the Gateway IP forwarded packet in](#)

["Default Route", for LAN device to access the Internet.](#)

[And 'Save running configuration to startup configuration'](#)

**Default routes** in hosts are often called default gateways. The **default gateway** is usually a filtering device such as a NAT gateway router, firewall, or proxy server.

"**Default route**" is the route selected by the router when no other existing route can be found for the destination address in the IP packet. All packets whose destination is not in the router's routing table will use the default route. The route usually leads to another router that also handles the packet: if it knows how to route the packet, it forwards the packet to the known route; otherwise, the packet is forwarded to the default route. Route to another router. With each forwarding, the route increases the distance by one hop.

**Note** CS-34816XG is a switch with route function. "Default Route" this feature is often referred to as "Default Gateway Configure" when operating in a Layer 2 switch environments. These settings for L2 and L3 have the same purpose, which is to set the default transmission destination for unknown IP data.

The default route in a TCP/IP network is a setting that tells the device how to forward the packet when the destination IP of the packet is not on the same subnet as the device, in order to achieve smooth access to the Internet. Use static routing settings to determine the gateway IP address to designate as the next hop.

**Configure the "default route" ( Gateway IP ) of the Fiber Optical Switch . Please refer to the following .**

## Default Route (Gateway IP)Configure Sample:

**Add IPv4 Static Route**

IP Address	0.0.0.0
Mask	<input checked="" type="radio"/> Network Mask 0.0.0.0
	<input type="radio"/> Prefix Length (0 - 32)
Next Hop Router IP Address	192.168.2.254
Metric	1 (1 - 255, default 1)

Buttons: Apply, Close

The default route setting Sample destination IP address and Mask IP Address are "0.0.0.0" (Means any IP), Gateway Router IP Address is "192.168.2.254", Metric is "1" .

**Note** The destination IP and netmask 0.0.0.0 (Means any IP) represents any destination IP address that does not match other route entries. According to this preset route, all traffic to the Internet will be forwarded to the gateway router (192.168.2.254). This will allow you to successfully access the Internet. ( Distance is an optional parameter, in this case we can leave it as default or set it to 1) .

- **IP Address / Destination IP :** In the Destination IP field, specify the IP address for the

destination.

- **Mask :**
  - **Network Mask :** Specify the subnet mask for the attached network.
  - **Prefix Length :** In the IPv4 Prefix Length field, specify the IPv4 prefix length for the destination.
- **Next Hop Router IP Address :** In the Next Hop IP Address field, specify the outgoing router IP address to use when forwarding traffic to the next router (if any) in the path toward the destination.
- **Metric :** Please fill in the cost ( hop count) of transmission you want to apply for routing purposes.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## ‘Save running configuration to startup configuration’

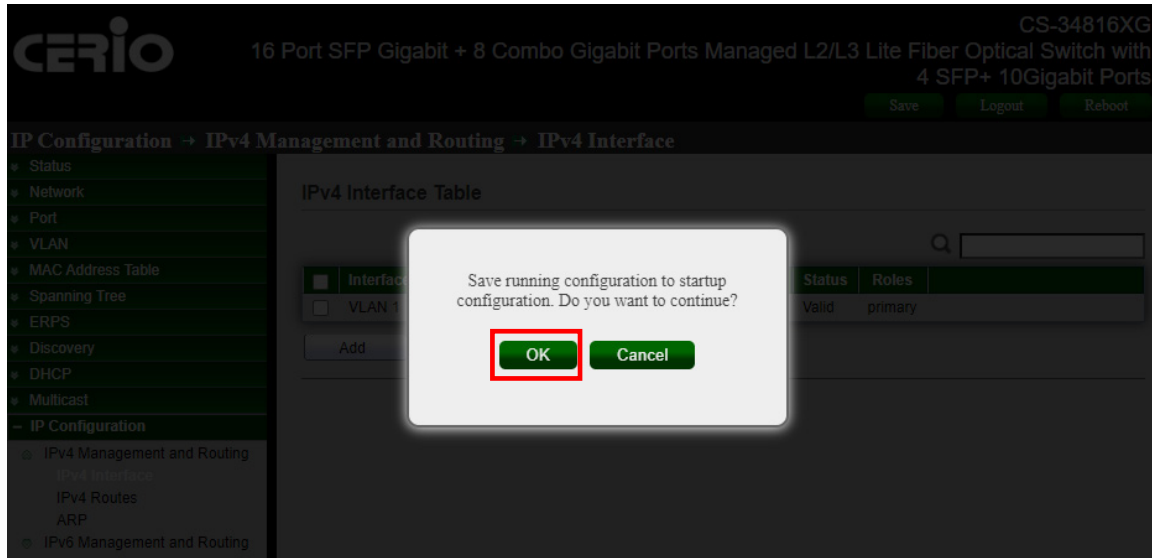

The screenshot shows the Cerio web interface for IPv4 Routing Table configuration. At the top right, there are three buttons: 'Save' (highlighted with a red box), 'Logout', and 'Reboot'. The breadcrumb navigation is 'IP Configuration → IPv4 Management and Routing → IPv4 Routes'. The left sidebar shows a tree view with 'IP Configuration' expanded to 'IPv4 Management and Routing'. The main content area displays the 'IPv4 Routing Table' with the following data:

<input type="checkbox"/>	Destination IP Prefix	Prefix Length	Route Type	Next Hop Router IP Address
<input type="checkbox"/>	0.0.0.0 ( Any IP )	24	Static	192.168.2.254 ( Gateway IP )
<input type="checkbox"/>	192.168.2.0	24	Directly Connected	

Below the table are three buttons: 'Add', 'Edit', and 'Delete'.

After successfully changing the new IP, execute "Save running configuration to startup configuration" to make the Gateway IP setting of Fiber Optical Switch take effect every time it is started.

Click the “ok” button to save ‘Save running configuration to startup configuration’.

## Static Route Configure Sample:

Add IPv4 Static Route

IP Address	162.159.200.1
Mask	<input checked="" type="radio"/> Network Mask 255.255.255.0
	<input type="radio"/> Prefix Length (0 - 32)
Next Hop Router IP Address	192.168.101.254
Metric	2 (1 - 255, default 1)

Apply Close

**The Static Route Sample IP Address is 162.159.200.1**

**Gateway Router IP Address is 192.168.101.254**

- **IP Address / Destination IP** : In the Destination IP field, specify the IP address for the destination.

<b>Note</b>	<p>This parameter specifies the IP network address of the final destination. Routing is always based on network numbers.</p> <p>If you need to specify a route to a single host, use the subnet mask 255.255.255.255 in the Subnet Mask field to force the network number to be the same as the host ID.</p>
-------------	--

- **Mask :**
  - **Network Mask :** Specify the subnet mask for the attached network.
  - **Prefix Length :** In the IPv4 Prefix Length field, specify the IPv4 prefix length for the destination.
- **Next Hop Router IP Address :** In the Next Hop IP Address field, specify the outgoing router IP address to use when forwarding traffic to the next router (if any) in the path toward the destination.

<b>Note</b>	<p>The next router is always one of the adjacent neighbors or the IP address of the local interface for a directly attached network.</p>
-------------	--

- **Metric :** Please fill in the cost ( hop count) of transmission you want to apply for routing purposes.

<b>Note</b>	<p>This metric represents the "cost" of transmission for routing purposes. IP routing uses "hop count" as a measure of cost, with a minimum value of 1 for directly connected networks. Enter a number that approximates the cost of this link. The number does not need to be exact, but must be between 1 and 255. In fact, 1 or 2 or 3 is usually suggested here to fill in the frequently used numbers.</p>
-------------	---

*Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.*

IPv4 Routing Table

Destination IP Prefix	Prefix Length	Route Type	Next Hop Router IP Address	Metric	Administrative Distance	Outgoing Interface
<input type="checkbox"/> 162.159.200.0	24	Static	192.168.101.254	2	1	VLAN 1*
<input type="checkbox"/> 192.168.101.0	24	Directly Connected				VLAN 1*

Field	Description
<b>Destination IP Prefix</b>	The IP Prefix for the destination
<b>Prefix Length</b>	The prefix length for the active route.
<b>Router Type</b>	The type of route: Static or Dynamic, depending on how the route was added.

<b>Next Hop Router IP Address</b>	The outgoing router IP address to use when forwarding traffic to the next router (if any) in the path toward the destination. The next router ( <b>ex. Your Gateway site IP address</b> ) is always one of the adjacent neighbors or the IP address of the local interface for a directly attached network.
<b>Metric</b>	The Metric value for the configured next hop. Specify the Metric (sometimes called administrative distance), which is an integer value from 1 to 255.
<b>Administrative Distance</b>	The route administrative distance of the configured route.
<b>Outgoing Interface</b>	The outgoing interface of the route active or inactive.

### 13.1.3 ARP

ARP (Address Resolution Protocol, Address Resolution Protocol) is a protocol that resolves an IP address into an Ethernet MAC address (or physical address). In a local area network, when a host or other network device has data to send to another host or device, it must know the other party's network layer and IP address. But just having an IP address is not enough, because IP data must be encapsulated into a frame to be sent through the physical network, so the sending station must also have the physical address of the receiving station, so the address needs to be mapped from the IP to the physical address. ARP is the protocol to achieve this function.

#### ARP table ( ARP Cache page )

After the device resolves the destination MAC address through ARP, it will add an IP address-to-MAC address mapping entry in its own ARP table for subsequent data forwarding to the same destination. ARP table are divided into “dynamic ARP table” and “static ARP table”.

Use the **ARP Table** ( ARP Cache page ) to view entries in the table, a table of the remote connections most recently seen by this switch.

**IP Configuration → IPv4 Management and Routing → ARP**

ARP Entry Age Out:  Sec (15 - 21600, default 1200)

Add    Edit    Delete

- **ARP Entry Age Out :** The setting of ARP aging time can be set from 15 seconds to 21600 seconds, and the default is 1200 seconds.
- **Clear ARP Table Entries :** Administrator can configure this “ARP Table for Clean ARP Table Entries by “All” and “Dynamic” and “Static” and by “Normal Age Out” (ARP aging set time) management.

<b>Note</b>	<p>1. Dynamic ARP Table :</p> <p>Dynamic ARP Table are automatically generated and maintained by the ARP protocol through ARP aging-out time , and can be outdated and invalid, updated by new ARP table , or overwritten by static ARP Table. When the invalid time expires and the interface is disabled, the corresponding dynamic ARP Table will be deleted automatically.</p> <p>2. Static ARP Table :</p> <p>Static ARP Table are manually configured and maintained, and will not be invalidated or overwritten by dynamic ARP Table.</p>
-------------	--

Click the **“Apply”** button to save your changes or **“Cancel”** the button to cancel settings.

## ARP Table

Administrator can configure this “ARP “page setting for “**add**” and “Edit” and “**Delete**” function management.

Field	Description
<b>Interface</b>	The routing interface associated with the ARP entry.
<b>IP Address</b>	Displays the IP address of the device (on a subnet) that is attached an existing routing interface of the switch.
<b>MAC Address</b>	Displays the unicast MAC address of the attached device. The address is six two-digit hexadecimal numbers separated by colons, for example, 40:bo:34:54:97:82
<b>Status</b>	<p>The type of ARP entry. Possible values are as follows:</p> <ul style="list-style-type: none"> <li>• <b>Local</b> : An ARP entry associated with one of the switch’s routing interface’s MAC addresses.</li> <li>• <b>Gateway</b> : A dynamic ARP entry whose IP address is that of a router.</li> <li>• <b>Static</b> : An ARP entry that was manually configured.</li> <li>• <b>Dynamic</b> : An ARP entry that was learned by the router.</li> </ul>

**Add ARP**

---

<b>Interface</b>	VLAN <input type="text" value="1"/>
	<small>Note: Only interfaces with a valid IPv4 address are available for selection</small>
<b>IP Address</b>	<input type="text" value="192.168.101.100"/>
<b>MAC Address</b>	<input type="text" value="8C:4D:EA:FE:05:BE"/>

- **Interface** : Administrator can select VLAN interface.
- **IP Address** : Enter the IPv4 address of add ARP table.
- **MAC Address** : Enter the MAC address of add ARP table.

**Note** Configuring a static ARP table can improve communication security. Static ARP Table restricts the use of specified MAC addresses when communicating with devices with specified IP addresses. At this time, the harmful network transmission cannot modify the mapping relationship between the IP address and the MAC address of the entry, so as to protect the communication between the device and the specified device. Normal communication.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 13.2 IPv6 Management and Interfaces

This chapter describes how to configure the IP interface for management access

Switch over the network. The switch supports IP version 4 and version 6,

And can be managed simultaneously by any of these address types. You can manually configure specific IPv4 or IPv6 addresses, or instruct the switch to obtain an IPv4 address from a BOOTP or DHCP server. An IPv6 address can only be configured manually.

### IPv6 Configuration – Set the IPv6 address for management access.

#### 13.2.1 IPv6 Interface

Administrator can configure this “IPv6 Interface Table” page setting for **“add”** and **“Edit”** and **“Delete”** function management.

**IPv6 Unicast Routing**  Enable

Apply Cancel

**IPv6 Interface Table**

Interface	Stateless	DHCPv6 Client			DAD Attempts
		Information Refresh Time	Minimum Information Refresh Time	Auto Configuration	
<input type="checkbox"/> VLAN 1	Disabled	86400	600	Enabled	1

Add Edit Delete

**IPv6 Unicast Routing** : Administrator can configure “Enable” this IPv6 Unicast Routing function.

**Note** Next to IPv6 Unicast Routing, specify whether IPv6 unicast routing is globally enabled by selecting the Enable radio button or the Disable radio button.

Click the “**Apply**” button to save your changes or “**Cancel**” the button to cancel settings.

Select the type of the IPv6 interface through which the IPv6 packets are forwarded.  
The Switch supports the VLAN interface type and Loopback interface type .

**Configuration” Interface” setting on “VLAN“ :**

- **Auto Configuration** : The IPv6 address autoconfiguration automatically creates new IPv6 interfaces for a given line description, and assigns IPv6 addresses for the interfaces.
- **DAD Attempts** : Configures the number of neighbor solicitations to be sent when performing duplicate address detection (DAD) for a unicast address configured on an interface. The no form of this command sets the number of attempts to the default value.

**DHCP6 Client :**

- **Stateless** : IPv6 stateLess AddressAutoConfiguration(SLAAC) function
- **Information Refresh Time** : 86400 by default
- **Minimum Information Refresh Time** : 600 by default

Click the “**Apply**” button to save your changes or “**Close**” the button to close settings.

### Configuration” Interface” setting on “Loopback” :

Add IPv6 Interface

Interface	<input checked="" type="radio"/> VLAN <span>1</span> <input type="radio"/> Loopback
Auto Configuration	<input checked="" type="checkbox"/> Enable
DAD Attempts	<input type="text" value="1"/> (0 - 600, default 1)
<b>DHCPv6 Client</b>	
Stateless	<input type="checkbox"/> Enable
Information Refresh Time	<input type="text" value="86400"/> (86400 - 4294967294, default 86400)
Minimum Information Refresh Time	<input type="text" value="600"/> (600 - 4294967294, default 600)

Loopback : The loopback address may be used by a node to send an IPv6 packet to itself. It must not be assigned to a physical or virtual interface.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 13.2.2 IPv6 Addresses

Administrator can configure this “IPv6 Address Table “page setting for **“add”** and **“Delete”** function management.

IP Configuration → IPv6 Management and Routing → IPv6 Addresses

  - ◆ VRRP Management

#### IPv6 Address Table

Interface VLAN 1 ▼

<input type="checkbox"/>	IPv6 Address Type	IPv6 Address	IPv6 Prefix Length	DAD Status
<input type="checkbox"/>	Link Local	fe80::8e4d:eaff:fe02:d864	64	Active
<input type="checkbox"/>	Multicast	ff02::1:ff02:d864		
<input type="checkbox"/>	Multicast	ff02::1		
<input type="checkbox"/>	Multicast	ff01::1		

## IPv6 Address Table

- **Interface :** From the Interface menu, Administrator can select the VLAN for the IPv6 Interface Selection page displays. The page also shows the IPv6 Interface Configuration table.

Field	Description
IPv6 Address Type	The IP Prefix for the destination
IPv6 Address	The prefix length for the active route.
IPv6 Prefix Length	The type of route: Static or Dynamic, depending on how the route was added.
DAD status	Shows the state of the IPv6 address. The state can be one of the following <ul style="list-style-type: none"> <li>• <b>Tent :</b> Routing is disabled or the address does not work because of a “duplicate address detection” (DAD) condition.</li> <li>• <b>Active :</b> The IPv6 address is valid and active.</li> <li>• <b>Preferred :</b> The IPv6 address was verified to be unique, valid, and active.</li> </ul>

Select the type of the IPv6 Address through which the IPv6 format are use.  
The Switch supports the Global type and Link Local type .

**Configuration” IPv6 Address Type” setting on “Global “ :**

**Add IPv6 Interface**

<b>Interface</b>	VLAN 1
<b>IPv6 Address Type</b>	<input checked="" type="radio"/> Global <input type="radio"/> Link Local
<b>IPv6 Address</b>	<input type="text" value="fe80::8e4d:eaff:fe30:dd55"/>
<b>Prefix Length</b>	<input type="text" value="32"/> (3 - 128)
<b>EUI-64</b>	<input checked="" type="checkbox"/> Enable

- **IPv6 Address Type :**

- **Global** : Configures an IPv6 global unicast address with a full IPv6 address including the network prefix and host address bits, followed by a forward slash, and a decimal value indicating how many contiguous bits of the address comprise the prefix.
- **Link Local** : Configures an IPv6 link-local address. The address prefix must be in the range of FE80 to FEBF. and you can configure only one link-local address per interface.( The specified address replaces a link-local address that was automatically generated for the interface).
- **IPv6 Address** : Full in your IPv6 address . Example of IPv6 input network range: 2001: 8E4D: EAFF: FE01: 0000: 0000: 0000: 0002 ~ FFFF: FFFF: FFFF: FFFE. (For IPv6 IP acquisition, May please contact your ISP provider ).
- **Prefix Length** : The Prefix Length of the IPv6 address of the Switch .
- **EUI-64** : Use this section to tick the Enable for EUI-64 format IPv6 configuration, Configures an IPv6 address for an interface using an EUI-64 interface ID in the low order 64 bits.

<b>Note</b>	<p>The switch must be configured with a link-local address. Therefore, any configuration process that enables IPv6 functionality, including address auto configuration, explicitly enabling IPv6 or manually assigning a global unicast address will also automatically generate a link-local unicast address. The prefix length for a link local address is fixed at 64 bits, and the host portion of the default address is based on the modified EUI-64 (Extended Universal Identifier) form of the interface identifier.</p>
-------------	--

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

**“Configuration” IPv6 Address Type” setting on “Link Local” :**

**Add IPv6 Interface**

<b>Interface</b>	VLAN 1
<b>IPv6 Address Type</b>	<input type="radio"/> Global <input checked="" type="radio"/> Link Local
<b>IPv6 Address</b>	<input style="width: 100%;" type="text" value="FE80::8E4D:EAFF:FE05:3406"/> <input style="width: 100%;" type="text" value="(3 - 128)"/>
	<input type="checkbox"/> Enable

- **IPv6 Address** : This section uses the Link Local address of the local identifier interface

required by the IPv6 mode address operation specification, for example, it is as “FE80::8E4D:EAFF:FE05:3406”.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 13.2.3 IPv6 Routers

You can enter static routes in the routing table using the IP > Static Routes (Add) page. Static routes may be required to force the use of a specific route to a subnet. Static routes do not automatically change in response to changes in network topology , so you should only configure a small number of stable routes to ensure network

This page system can displayed IPv6 Routing Table for “Destination IP Prefix” / Prefix Length / Route Type / Next Hop Router IP Address / Metric / Administrative Distance / Outgoing Interface information.

Administrator can configure this “IPv6 Routing Table” page setting for **“add”** and **“Edit”** and **“Delete”** function management.

The screenshot shows a web interface for IPv6 Routing Table configuration. The breadcrumb path is: IP Configuration → IPv6 Management and Routing → IPv6 Routes. The left sidebar contains a tree view with categories like Status, Network, Port, VLAN, MAC Address Table, Spanning Tree, ERPS, Discovery, DHCP, Multicast, and IP Configuration. Under IP Configuration, IPv6 Management and Routing is expanded to show IPv6 Interface, IPv6 Addresses, IPv6 Routes, IPv6 Neighbors, Rip Routes Management, Ospf Routes Management, and VRRP Management. The main content area is titled 'IPv6 Routing Table' and contains a table with the following headers: Destination IP Prefix, Prefix Length, Route Type, Next Hop Router IP Address, and Metric. Below the table, it indicates '0 results found.' and provides three buttons: Add, Edit, and Delete.

IPv6 Routing Table

🔍

Destination IP Prefix	Prefix Length	Route Type	Next Hop Router IP Address	Metric	Administrative Distance	Outgoing Interface
0 results found.						

Field	Description
<b>Destination IP Prefix</b>	The IP Prefix for the destination
<b>Prefix Length</b>	The prefix length for the active route.
<b>Router Type</b>	<p>The type of protocol for the active route:</p> <ul style="list-style-type: none"> <li>• Static. The route was manually defined.</li> <li>• ND (Neighbor Discovery). The route was discovered through the ND protocol.</li> <li>• Connected. The route was derived from a manually configured IPv6 address.</li> </ul>
<b>Next Hop Router IP Address</b>	The next hop IPv6 address for the active route.
<b>Metric</b>	<p>The Metric value for the configured next hop.</p> <p>Specify the Metric (sometimes called administrative distance), which is an integer value from 1 to 255.</p>
<b>Administrative Distance</b>	The route administrative distance of the configured route.
<b>Outgoing Interface</b>	The outgoing interface of the route active or inactive.

## Add IPv6 Static Route

IPv6 Prefix	<input type="text"/>
IPv6 Prefix Length	<input type="text"/> (0 - 128)
Next Hop Router IP Address	<input type="text"/>
Metric	<input type="text" value="1"/> (1 - 255, default 1)

- **IPv6 Prefix** : In the IPv6 Prefix field, specify the IPv6 network prefix for the destination..
- **IPv6 Prefix Length** : In the IPv6 Prefix Length field, specify the IPv6 prefix length for the destination..
- **Next Hop Router IP Address** : In the Next Hop IPv6 Address field, specify the outgoing router IPv6 address to use when forwarding traffic to the next router (if any) in the path toward the destination.

<b>Note</b>	The next router is always one of the adjacent neighbors or the IPv6 address of the local interface for a directly attached network.
-------------	---

- **Metric** : Please fill in the cost ( hop count) of transmission you want to apply for routing purposes.

<b>Note</b>	This metric represents the "cost" of transmission for routing purposes. IP routing uses "hop count" as a measure of cost, with a minimum value of 1 for directly connected networks. Enter a number that approximates the cost of this link. The number does not need to be exact, but must be between 1 and 255. In fact, 1 or 2 or 3 is usually suggested here to fill in the frequently used numbers.
-------------	--

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 13.2.4 IPv6 Neighbors

Administrator can configure this “IPv6 Neighbor Table” page setting for **“add”** and **“Edit”** and **“Delete”** function management.

**IP Configuration → IPv6 Management and Routing → IPv6 Neighbors**

Add Edit Delete

### Clear Neighbor Table

The administrator can select the filter Status type including by "All" or "Dynamic" or "Static" or "N/A" to quickly select batches to clear the "IPv6 Neighbor Table".

### Use the "Search" menu to consult the list.

Search by "Keyword" using the Search menu and field. For example, '8c'. Then click the Search icon button. If the address exists, show the entry.

Field	Description
	The interface whose settings are displayed in the current table row.
<b>Interface</b>	This field displays the ID number of the IPv6 interface on which the IPv6 address is created or through which the neighboring device can be reached.
<b>IPv6 Address</b>	The IPv6 address of the neighbor or interface.
<b>MAC Address</b>	This field displays the MAC address of the IPv6 interface on which the IPv6 address is configure or the MAC address of the neighboring device.
<b>Status</b>	The state of the neighbor cache entry. The states for "dynamic entries" or "Static entries" in the IPv6 neighbor discovery cach.
<b>Router</b>	Neighbor for the active route.

**Add Neighbor**

---

<b>Interface</b>	VLAN <input type="text" value="1"/>
<b>IP Address</b>	<input type="text"/>
<b>MAC Address</b>	<input type="text"/>

- **Interface** : Select the type of IPv6 interface for VLAN ID configure.
- **IP Address** : Specify the IPv6 address of the neighboring device which can be reached through the interface.
- **MAC Address** : Specify the MAC address of the neighboring device which can be reached through the interface.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

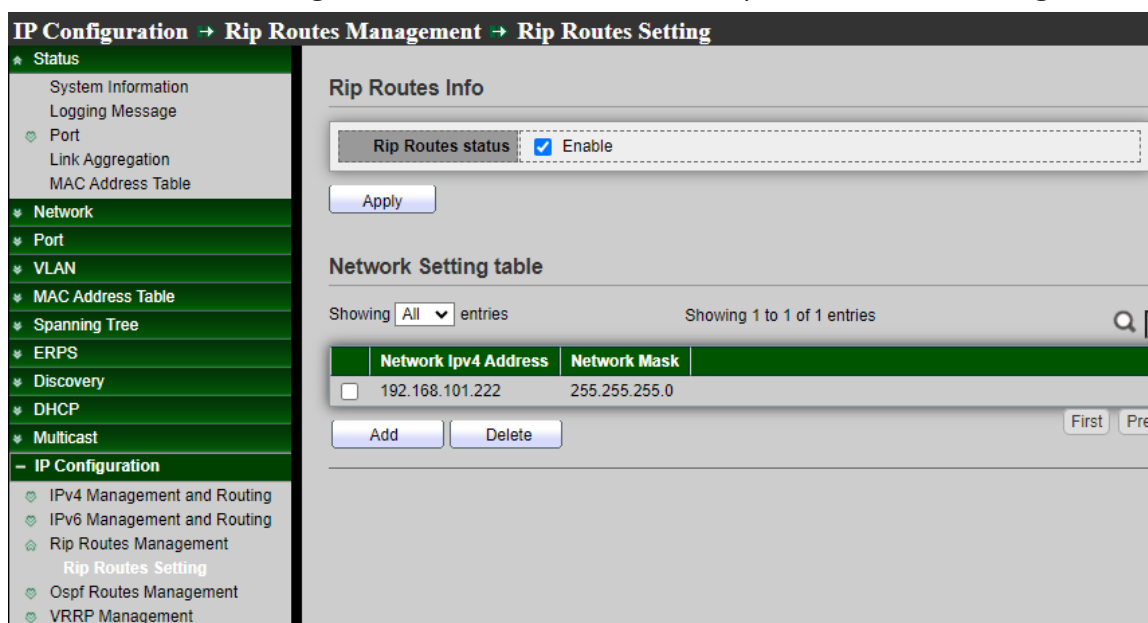

## 13.3 RIP Routes Setting

This Switch IPv4 routing, Support versions of RIPv2. and RIP v2 uses multicast to send routing table updates. Routing Information Protocol (RIP) is used to manage router information in a self-contained network, such as a corporate LAN or a private WAN. With RIP, a gateway host sends its routing table to the closest router each 30 seconds. This router, then sends the contents of its routing tables to neighboring routers.

RIP is best for small networks. This is because the transmission of the full routing table each 30 seconds can put a large traffic load on the network, and because RIP tables are limited to 15 hops. So, OSPF is a better alternative for larger networks.

### 13.3.1 Rip Routes Setting

Administrator can configure Enable or disable for this “Rip Routes status” management.

Administrator can configure this “Rip Routes Info “page setting for “add” and “Delete” table management.

Field	Description
Network IPv4 Address	Displays the routing IPv4 IP address to be added to the advertised RIP protocol Routes.

## Network Mask

Displays the routing mask to be added to the advertised RIP protocol Routes.

Network Setting table

---

Network Ipv4 Address	<input type="text" value="192.168.101.222"/>
Network Mask	<input type="text" value="255.255.255.0"/>

- **Network IPv4 Address** : The IPv4 address to be announced to visit the Routing the RIP v2 protocol,.
- **Network Mask** : The Mask to be announced to visit the Routing the RIP v2 protocol,

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 13.4 OSPF Routes Management

On the Areas tab, Add an Area ID for the area in x.x.x.x format. This is the identifier that each neighbor must accept to be part of the same area. OSPF determines routes dynamically by obtaining information from other routers and advertising routes to other routers by way of Link State Advertisements (LSAs). The router keeps information about the links between it and the destination and can make highly efficient routing decisions. A cost is assigned to each router interface, and the best routes are determined to be those with the lowest costs, when summed over all the encountered outbound router interfaces and the interface receiving the LSA.

Hierarchical techniques are used to limit the number of routes that must be advertised and the associated LSAs. Because OSPF dynamically processes a considerable amount of route information, it has greater processor and memory requirements than does RIP.

### 13.4.1 Ospf Routes Setting

Administrator can configure Enable or disable for this “OSPF Routes status “ management.

**IP Configuration → Ospf Routes Management → Ospf Routes Setting**

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 13.5 VRRP Management

VRRP creates a virtual router, known as a default gateway, which acts as a backup if the main router fails. The master router sends out advertisements at regular intervals. Backup routers monitor these advertisements to determine the status of the master router. If the master router fails, the backup router with the highest priority becomes the new master router,

The Virtual Router Redundancy V2 Protocol (VRRP) is a computer networking protocol that increases the availability of the default gateway servicing hosts on a wireless LAN. This protocol operates by establishing a virtual router, an abstract representation of multiple routers acting as a group. The group presents itself as a single default gateway to the hosts on the subnet.

The virtual router’s member possessing the highest priority becomes the master and forwards packets sent to the virtual router’s IP address. The remaining members operate in standby, ready to take over should the master become unavailable. Thus, the Virtual Router Redundancy Protocol enhances network reliability through router redundancy.

### 13.5.1 VRRP Interfaces Setting

Administrator can configure this “VRRP Interface Setting” page setting for **“add”** and **“Delete”** function management.

**IP Configuration → VRRP Management → VRRP Interfaces Setting**

### VRRP Interface Setting table

	Router ID	Virtual IP	State	Priority	Advertise	Preempt	Delay
<input type="checkbox"/>	1	192.168.101.100	init	100	255	Enabled	0

Field	Description
<b>Router Id</b>	Displays the ID number of the virtual router.
<b>Virtual IP</b>	Displays the IP address and of an IP routing domain that is associated to a virtual router.
<b>State</b>	<p>Displays the status of the virtual router.</p> <ul style="list-style-type: none"> <li>● <b>Master:</b> This switch functions as the master router.</li> <li>● <b>Backup:</b> This switch functions as a backup router.</li> <li>● <b>Init:</b> This Switch is initiating the VRRP protocol or when the Uplink Status field displays Dead.</li> </ul>
<b>Priority</b>	Displays the Switch Virtual Router Redundancy Protocol (VRRP) priority level (1 to 255) of the entry.
<b>Advertise</b>	Displays the Switch Virtual Router Redundancy Protocol (VRRP) Advertisement Interval.
<b>Preempt</b>	Displays the Switch Virtual Router Redundancy Protocol (VRRP) preempt Enable or Disable status.
<b>Delay</b>	Displays the Switch Virtual Router Redundancy Protocol (VRRP) preempt Preempt delay time.

**Add IPv4 VRRP Interface**

<b>Interface</b>	VLAN <span style="border: 1px solid #ccc; padding: 2px;">1</span>
<b>Router ID</b>	<span style="border: 1px solid #ccc; padding: 2px;">2</span> (1 - 5)
<b>Virtual IP</b>	<span style="border: 1px solid #ccc; padding: 2px;">192.168.101.100</span>
<b>Priority</b>	<span style="border: 1px solid #ccc; padding: 2px;">1</span> (1 - 254, default 100)
<b>Advertise</b>	<span style="border: 1px solid #ccc; padding: 2px;">1</span> (1 - 255, default 1)
<b>Preempt</b>	<input checked="" type="checkbox"/> Enable
<b>Delay</b>	<span style="border: 1px solid #ccc; padding: 2px;">1</span> (1 - 255)

Apply
Close

- **Interface** : Select a VLAN interface.
- **Router ID** : Select a virtual router number (1 to 5) for which this VRRP entry is created.
- You can configure up to five virtual routers for one network..
- **Virtual IP** : Enter the IP address of the virtual router .
- **Priority** : Enter a number (between 1 and 254) to set the priority level. The bigger the number, the higher the priority. The default is 100.

<b>Note</b>	Configure the priority level (1 to 254) to set which backup router to take over in case the master router goes down. The backup router with the highest priority will take over..
-------------	---

- **Advertise** : Specify the number of seconds between Hello message transmissions. The default is 1. All routers participating in the virtual router must use the same advertisement Interval.

<b>Note</b>	The master router sends out Hello messages to let the other backup routers know that it is still up and running. The time interval between sending the Hello messages is the advertisement interval.
-------------	--

- **Preempt** : Select this option to activate preempt mode.
- **Delay** : Enter a delay time (between 1 and 255) .

**Note**

If the master router is unavailable, a backup router assumes the role of the master router. However, when another backup router with a higher priority joins the network, it will preempt the lower priority backup router that is the master. Disable preempt mode to prevent this from happening.

A layer 3 device with the same IP address as the virtual router will become the master router regardless of the preempt mode.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14. Security

### 14.1 RADIUS

Network architecture can establish a Remote Authorization login Service (RADIUS) server to provide a centralized 802.1X or MAC-based network access control for all of its devices. This switch can act as a RADIUS client that uses the RADIUS server to provide centralized security and authorization and user authentication.

Administrator can set account for the switch on the RADIUS server, and configure that RADIUS server along with the other parameters on the RADIUS page.

**Security → RADIUS**

<input type="checkbox"/>	Server Address	Server Port	Priority	Retry	Timeout	Usage
<input type="checkbox"/>	192.168.2.99	1812	1	3	3	All

➤ **Use Default Parameters :**

- **Retry:** Set default retry number ,Enter the number of transmitted requests that are sent to the RADIUS server before a failure is considered to have occurred. Default is 3.
- **Timeout:** Set default timeout value ,Enter the number of seconds that the switch waits for

an answer from the RADIUS server before retrying the query, or switching to the next server. Default is 3.

- **Key String:** Set default RADIUS key string ,The key string used security communications between the switch and the RADIUS server by MD5.This key must match the key configured on the RADIUS server. If don't have an encrypted key string (from other device), please enter the key string in plaintext form.

Click the “**Apply**” button to save your changes settings.

Field	Description
Server Address	RADIUS server address.
Server Port	RADIUS server port.
Priority	RADIUS server priority (smaller value has higher priority). RADIUS session will try to establish with the server setting which has highest priority. If failed, it will try to connect to the server with next higher priority.
Retry	RADIUS server retry value. If it is fail to connect to server, it will keep trying until timeout with retry times.
Timeout	RADIUS server timeout value. If it is fail to connect to server, it will keep trying until timeout.
Usage	RADIUS server usage type <ul style="list-style-type: none"> <li>• <b>Login:</b> For login authentication.</li> <li>• <b>802.1x:</b> For 802.1x authentication.</li> <li>• <b>All:</b> For alltypes.</li> </ul>

### Add RADIUS Server

<b>Address Type</b>	<input checked="" type="radio"/> Hostname <input type="radio"/> IPv4 <input type="radio"/> IPv6	
<b>Server Address</b>	<input type="text" value="192.168.2.99"/>	
<b>Server Port</b>	<input type="text" value="1812"/>	(0 - 65535, default 1812)
<b>Priority</b>	<input type="text" value="1"/>	(0 - 65535)
<b>Key String</b>	<input checked="" type="checkbox"/> Use Default <input type="text"/>	
<b>Retry</b>	<input checked="" type="checkbox"/> Use Default <input type="text" value="3"/> (1 - 10, default 3)	
<b>Timeout</b>	<input checked="" type="checkbox"/> Use Default <input type="text" value="3"/> Sec (1 - 30, default 3)	
<b>Usage</b>	<input type="radio"/> Login <input type="radio"/> 802.1X <input checked="" type="radio"/> All	

- **Address Type:** Select IP Version 4 / 6 or use Hostname type, In add dialog, user need to specify server Address Type
  - **Hostname:** Use domain name as server address.
  - **IPv4:** Use IPv4 as server address.
  - **IPv6:** Use IPv6 as server address.
- **Server Address:** Please enter the IP address or hostname of the RADIUS server. In add dialog, user need to input server address based on address type. In edit dialog, it shows current edit server address.
- **Server Port:** Set port of RADIUS server.
- **Priority:** Administrator can enter the priority of the server. The priority determines the order that the switch attempts to contact the servers to authenticate users. The switch first starts with the highest priority server. 0 is the high priority, Set RADIUS server priority (smaller value has higher priority). RADIUS session will try to establish with the server setting which has highest priority. If failed, it will try to connect to the server with next higher priority.
- **Key String:** Administrator can select user defined Encrypted or Plaintext to enter the key string form used for authenticating and encrypting the communication between the switch and the

RADIUS server. This key must match the key configured on the RADIUS server. If administrator select use default (checked in checkbox) will use the default key string.

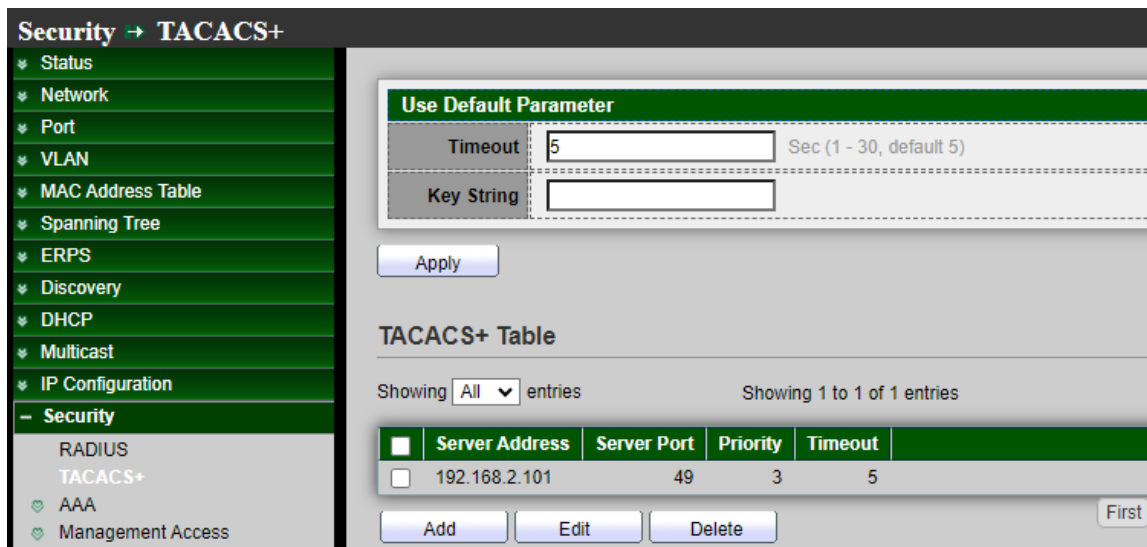

- **Retry:** Select User Defined to enter the number of requests that are sent to the RADIUS server before a failure is considered to have occurred, or select Use Default to use the default value.
- **Timeout:** Select User Defined to enter the number of seconds that the switch waits for an answer from the RADIUS server before retrying the query or switching to the next server, or select Use Default to use the default value. Set RADIUS server timeout value. If it is fail to connect to server, it will keep trying until timeout.
- **Usage:** Select the RADIUS server authentication type.
  - **Login:** RADIUS server is used for authenticating users that want to administer the switch.
  - **802.1X:** RADIUS server is used for authentication in 802.1X access control.
  - **All:** RADIUS server is used for authenticating user that wants to administer the switch and for authentication in 802.1X access control.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.2 TACACS+

Administrator can be configuration TACACS+ to connection TACACS+ Server to provide authentication and authorization for all devices in the organization.

This page allow user to add, edit or delete TACACS+ server settings and modify default parameter of TACACS+ server.

➤ **Use Default Parameters :**

- **Timeout:** Enter the amount of time in seconds that passes before the connection between the switch and the TACACS+ server times out. If a value is not entered for an individual server, the value is taken from this field, default is 5.
- **Key String:** Enter the default key string in encrypted or plaintext form used for communicating with all TACACS+ servers.

**Note** If administrator don't enter the default key string here, the key entered on the Add page must match the encryption key used by the TACACS+ server or enter the default key string here and a key string for an individual TACACS+ server, the key string configured for the individual TACACS+ server takes precedence.

Click the **“Apply”** button to save your changes settings.

Field	Description
<b>Server Address</b>	TACACS+ server address.
<b>Server Port</b>	TACACS+ server port.
<b>Priority</b>	TACACS+ server priority (smaller value has higher priority). TACACS+ session will try to establish with the server setting which has highest priority. If failed, it will try to connect to the server

	with next higher priority.
<b>Retry</b>	RADIUS server retry value. If it is fail to connect to server, it will keep trying until timeout with retry times.
<b>Timeout</b>	TACACS+ server timeout value. If it is fail to connect to server, it will keep trying until timeout.

**Add TACACS+ Server**

<b>Address Type</b>	<input type="radio"/> Hostname <input checked="" type="radio"/> IPv4 <input type="radio"/> IPv6	
<b>Server Address</b>	<input type="text" value="192.168.2.101"/>	
<b>Server Port</b>	<input type="text" value="49"/>	(0 - 65535, default 49)
<b>Priority</b>	<input type="text" value="2"/>	(0 - 65535)
<b>Key String</b>	<input checked="" type="checkbox"/> Use Default <input type="text"/>	
<b>Timeout</b>	<input checked="" type="checkbox"/> Use Default <input type="text" value="5"/> Sec (1 - 30, default 5)	

- **Address Type:** Select IP Version 4 / 6 or use Hostname typem, In add dialog, user need to specify server Address Type
  - **Hostname:** Use domain name as server address.
  - **IPv4:** Use IPv4 as server address.
  - **IPv6:** Use IPv6 as server address.
- **Server Address:** In add dialog, user need to input server address based on address type. In edit dialog, it shows current edit server address.
- **Server Port:** Set TACACS+ server port.
- **Priority:** Administrator can enter the priority of the server. The priority determines the order that the switch attempts to contact the servers to authenticate users. The switch first starts with the highest priority server. 0 is the high priority, Set TACACS+ server priority (smaller value has higher priority). TACACS+ session will try to establish with the server setting which has highest priority. If failed, it will try to connect to the server with next higher priority.

- **Key String:** Administrator can select user defined Encrypted or Plaintext to enter the key string form used for authenticating and encrypting the communication between the switch and the TACACS+ server. This key must match the key configured on the TACACS+ server. If administrator select use default (checked in checkbox) will use the default key string.
- **Timeout:** Set TACACS+ server timeout value. If it is fail to connect to server, it will keep trying until timeout.

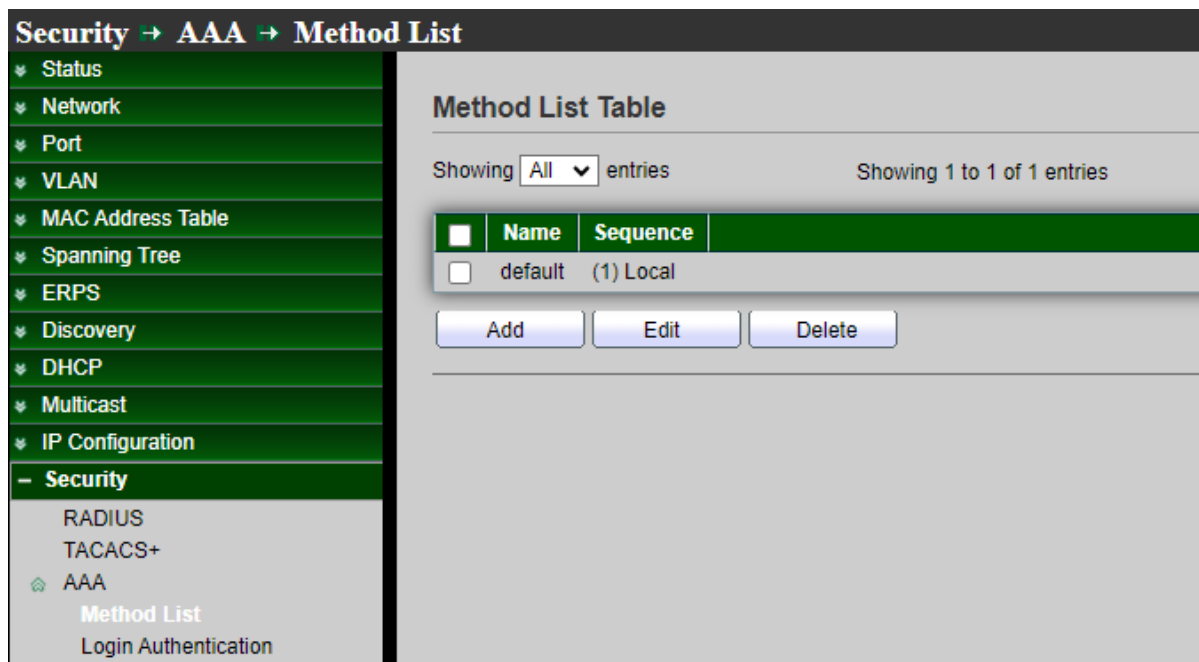

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.3 AAA

### 14.3.1 Method List

Administrator can set groups of AAA security, each group have 4 method table, each method can select 1 of 6 type which contains Empty / None / Local / Enable / RADIUS and TACACS+.

This page allow user to add, edit or delete login authentication list settings (The “default” list cannot be deleted.). The line combined to this list will authenticate login user by methods in this list. If the first method is failed, it will try to use the next priority method to authenticate if it exists. With RADIUS and TACACS+ methods, the failed means connecting to server fail. With Local method, the failed means cannot find the user in local database.

The screenshot shows the configuration page for AAA Method List. On the left is a navigation tree with categories like Status, Network, Port, VLAN, MAC Address Table, Spanning Tree, ERPS, Discovery, DHCP, Multicast, IP Configuration, and Security. Under Security, there are sub-items for RADIUS, TACACS+, AAA, Method List, and Login Authentication. The main content area is titled 'Method List Table' and shows a table with one entry named 'default' with a sequence of '(1) Local'. Below the table are 'Add', 'Edit', and 'Delete' buttons. The table also includes a 'Showing' dropdown set to 'All' and a status indicator 'Showing 1 to 1 of 1 entries'.

<input type="checkbox"/>	Name	Sequence
<input type="checkbox"/>	default	(1) Local

Field	Description
<b>Name</b>	Login authentication list name. This name should be different from other existing lists.
<b>Sequence</b>	<p>Priority of login authentication method.</p> <ul style="list-style-type: none"> <li>• <b>None:</b> Authenticated with any condition.</li> <li>• <b>Local:</b> Use local accounts database to authenticate</li> <li>• <b>TACACS+:</b> Use remote TACACS+ server to authenticate.</li> <li>• <b>RADIUS:</b> Use remote Radius server to authenticate.</li> <li>• <b>Enable:</b> Use local enable password to authenticate</li> </ul>

- **Name:** Login authentication list name. This name should be different from other existing lists.
- **Method 1:** Select first priority of login authentication method.
  - **None:** Authenticated with any condition.
  - **Local:** Use local accounts database to authenticate
  - **TACACS+:** Use remote TACACS+ server to authenticate.
  - **RADIUS:** Use remote Radius server to authenticate.
  - **Enable:** Use local enable password to authenticate.
- **Method 2:** Select first priority of login authentication method.
  - **None:** Authenticated with any condition.

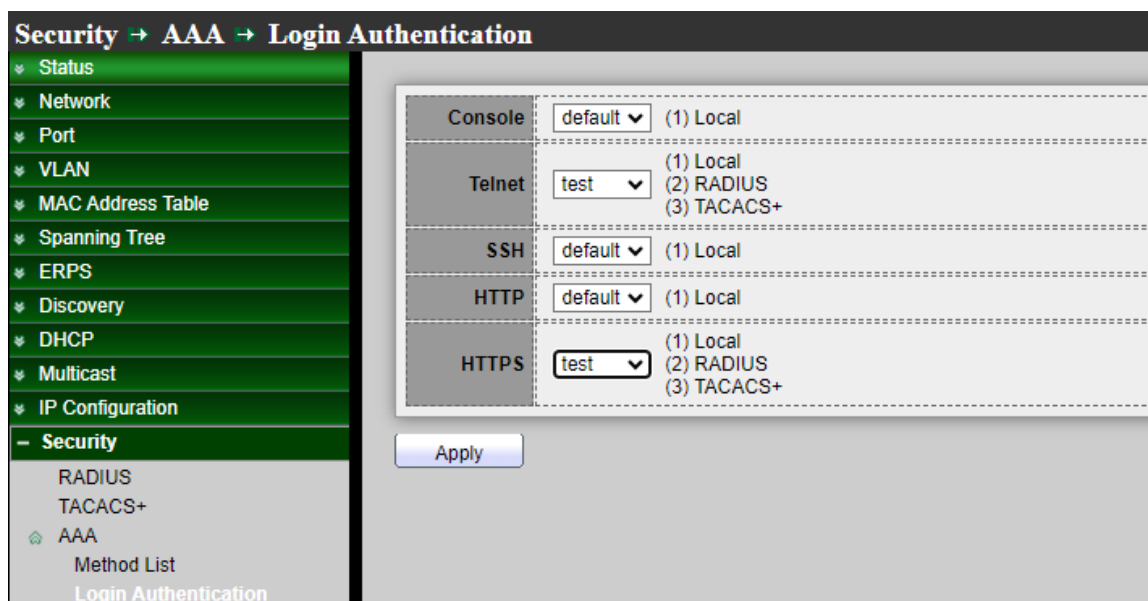

- **Local:** Use local accounts database to authenticate TACACS+: Use remote TACACS+ server to authenticate.
- **RADIUS:** Use remote Radius server to authenticate.
- **Enable:** Use local enable password to authenticate.
- **Method 3:** Select first priority of login authentication method.
  - **None:** Authenticated with any condition.
  - **Local:** Use local accounts database to authenticate TACACS+: Use remote TACACS+ server to authenticate.
  - **RADIUS:** Use remote Radius server to authenticate.
  - **Enable:** Use local enable password to authenticate.
- **Method 4:** Select first priority of login authentication method.
  - **None:** Authenticated with any condition.
  - **Local:** Use local accounts database to authenticate TACACS+: Use remote TACACS+ server to authenticate.
  - **RADIUS:** Use remote Radius server to authenticate.
  - **Enable:** Use local enable password to authenticate.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 14.3.2 Login Authentication

When administrator has created security groups in "AAA→method" then administrator can select different security group in service port.

Field	Description
Console	Specify login authentication list combined on console
Telnet	Specify login authentication list combined on Telnet
SSH	Specify login authentication list combined on SSH
HTTPS	Specify login authentication list combined on HTTPS

Click the **“Apply”** button to save your changes settings.

## 14.4 Management Access

### 14.4.1 Management Service

Administrator can select enable Telnet / SSH / HTTP / HTTPS / SNMP by different protocol to login service and configuration login timeout limit and password error retry count limit.

The screenshot shows the configuration page for Management Service, located under Security > Management Access > Management Service. The left sidebar contains a navigation tree with categories like Status, Network, Port, VLAN, MAC Address Table, Spanning Tree, ERPS, Discovery, DHCP, Multicast, IP Configuration, Security, RADIUS, TACACS+, AAA, Management Access, Authentication Manager, Port Security, Protected Port, Storm Control, DoS, Dynamic ARP Inspection, DHCP Snooping, IP Source Guard, ACL, QoS, Diagnostics, and Management.

The main configuration area is divided into four sections:

- Management Service:** Contains checkboxes for enabling Telnet, SSH, HTTP (checked), HTTPS, and SNMP.
- Session Timeout:** Contains input fields for login timeout in minutes for Console, Telnet, SSH, HTTP, and HTTPS, all set to 10. The range is Min (0 - 65535, default 10).
- Password Retry Count:** Contains input fields for password error retry count for Console, Telnet, and SSH, all set to 3. The range is (0 - 120, default 3).
- Silent Time:** Contains input fields for silent time in seconds for Console, Telnet, and SSH, all set to 0. The range is Sec (0 - 65535, default 0).

An **Apply** button is located at the bottom of the configuration area.

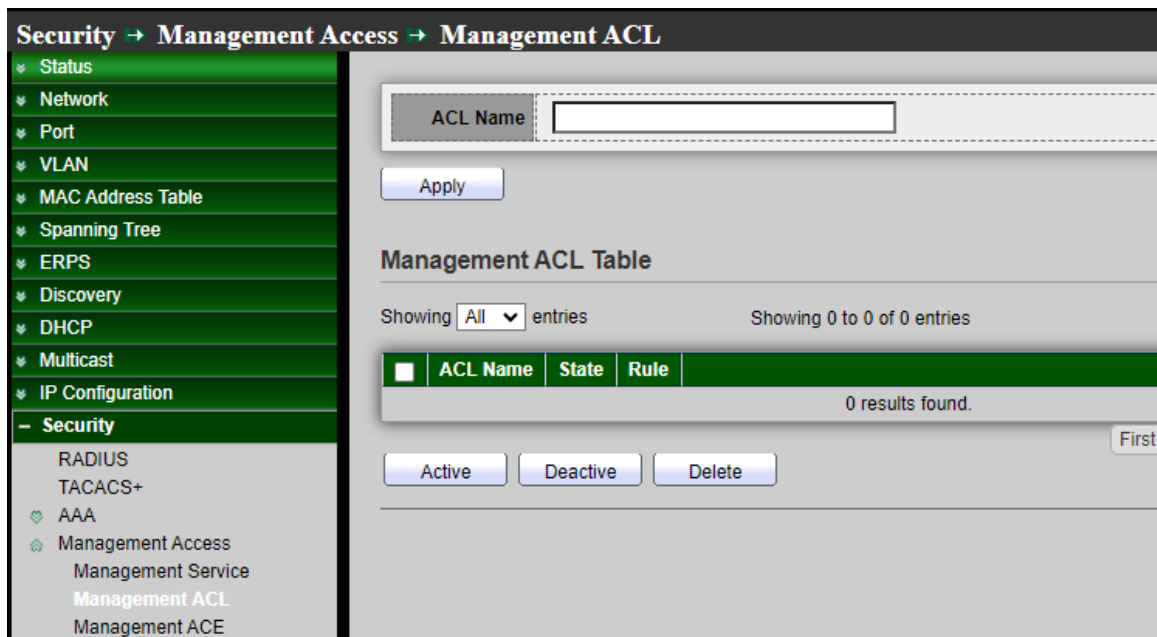

- **Management Service:** Management service admin state.
  - **Telnet:** Connect CLI through telnet.
  - **SSH:** Connect CLI through SSH.
  - **HTTP:** Connect WEBUI through HTTP.
  - **HTTPS:** Connect WEBUI through HTTPS.
  - **SNMP:** Manage switch through SNMP.
- **Session Timeout:** Set session timeout minutes for user access to user interface. 0 minutes means never timeout, After login management page, in the set time if not session then system will auto timeout, administrator need re-login.
  - **Console:** Set console for session timeout 0~65535 minutes.
  - **Telnet:** Set Telnet for session timeout 0~65535 minutes.
  - **SSH:** Set SSH for session timeout 0~65535 minutes.
  - **HTTP:** Set HTTP for session timeout 0~65535 minutes.
  - **HTTPS:** Set HTTPS for session timeout 0~65535 minutes.
- **Password Retry Count:** Retry count is the number which CLI password input error tolerance count. After input error password exceeds this count, the CLI will freeze after silent time, If login error reaches the set value then login page will be kicked out, administrator need reopen the login page.
  - **Console:** Set console for password Retry count of 0~120 .
  - **Telnet:** Set Telnet for password Retry count of 0~120 .
  - **SSH:** Set SSH for password Retry count of 0~120 .
- **Silent Time:** This function to be matched "Password Retry Count" function, if login error reaches the set value within then set value of silent time will can't be reopen login page until the set time end ,After input error password exceeds password retry count, the CLI will freeze after silent time.
  - **Console:** Set console for Silent Time of 0~65535 minutes .
  - **Telnet:** Set Telnet for Silent Time of 0~65535 minutes .
  - **SSH:** Set SSH for for Silent Time of 0~65535 minutes .

## 14.4.2 Management ACL

Administrator can create ACL and set Active or Deactive the rules.

If administrator set "Active" will be apply "Management ACE" rules. ACL can set which ports is Permit or Deny connection to which services of the switch management interface.

<b>Note</b>	If only create one ACL Profile and click Active then these all ports and services will be all denied.
-------------	---

➤ **ACL Name:** Input MAC ACL name.

Click the **“Apply”** button to save your changes settings.

Field	Description
ACL Name	Display Management ACL name
State	Display Management ACL whether active.
Rule	Display the number Management ACE rule of ACL

Set the **“Active”** and **“Deactive”** and **“Delete”** for this table management.

### 14.4.3 Management ACE

This management ACE page is to create an ACL profile rule. Administrator can select an created ACL profile to set security rule. If set the ACE only use Telnet a single rule. After confirmation the rule will apply to ACL profile.

Administrator can go to "management ACL" page click "Active" button to enable the rule. After active the rule, this management page will can't operating only use Telnet protocol to management, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

**Security → Management Access → Management ACE**

<b>IPv6</b>	<input type="text"/>	/	<input type="text" value="128"/> (1 - 128)

- **ACL Name:** Display the ACL name to which an ACE is being added.
- **Priority:** Set this rule priority, Specify the priority of the ACE. ACEs with higher sequence are processed first (1 is the highest priority). Only available on Add Dialog.
- **Service:** Select the type service of rule.
  - **All:** All services .
  - **HTTP:** Only HTTP service .
  - **HTTPS:** Only HTTPS service.
  - **SNMP:** Only SNMP service.
  - **SSH:** Only SSH service.
  - **Telnet:** Only Telnet service
- **Action:** Select the action after ACE match packet.
  - **Permit:** Forward packets that meet the ACE criteria.
  - **Deny:** Drop packets that meet the ACE criteria.

- **Port:** Select ports which will be matched.
- **IP Version:** Select the type of source IP address.
  - **All:** All IP addresses can access.
  - **IPv4:** Specify IPv4 address ca access.
  - **IPv6:** Specify IPv6 address ca access
- **IPv4:** Enter the source IPv4 address value and mask to which will be matched.
- **IPv6:** Enter the source IPv6 address value and mask to which will be matched.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.5 Authentication Manager

### 14.5.1 Property

This page allow user to edit authentication global settings and some port mods’ configurations, Administrator can edit authentication global settings and some port mods’ configurations.

Entry	Port	Authentication Type			Host Mode	Order	Method	Guest VLAN	VLAN Assign
		802.1x	MAC-Based	WEB-Based					
<input checked="" type="checkbox"/>	1 GE1	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	2 GE2	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	3 GE3	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	4 GE4	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input checked="" type="checkbox"/>	5 GE5	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	6 GE6	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	7 GE7	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	8 GE8	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static
<input type="checkbox"/>	9 GE9	Disabled	Disabled	Disabled	Multiple Authentication	802.1x	RADIUS	Disabled	Static

- **Authentication Type :** Set checkbox to enable/disable following authentication types
  - 802.1x: Use IEEE 802.1x to do authentication
  - MAC-Based: Use MAC address to do authentication
  - WEB-Based: Prompt authentication web page for user to do authentication
- **Guest VLAN :** Set checkbox to enable/disable guest VLAN, if guest VLAN is enabled, you need to select one available VLAN ID to be guest VID.

➤ **MAC-Based User ID Format** : Select mac-based authentication RADIUS username/password ID format.

  - MAC-Based 802.1x
  - WEB-Based 802.1x
  - 802.1x MAC-Based WEB-Based
  - 802.1x WEB-Based MAC-Based
- **Method** : Support following authentication method order combinations. These orders only available on MAC-Based authentication and WEB-Based authentication. 802.1x only support Radius method.
- **Local** : Use DUT's local database to do authentication
  - **Radius** : Use remote RADIUS server to do authentication
- **Guest VLAN** : Set checkbox to enable/disable guest VLAN.
- **VLAN Assign Mode** : Support following VLAN assign mode and only apply when source is RADIUS.
- **Disable**: Ignore the VLAN authorization result and keep original VLAN of host.
  - **Reject**: If get VLAN authorized information, just use it. However, if there is no VLAN authorized information, reject the host and make it unauthorized. Local Radius.
  - **Static**: If get VLAN authorized information, just use it. If there is no VLAN authorized information, keep original VLAN of host.

Click the **"Apply"** button to save your changes or **"Close"** the button to close settings.

### 14.5.2 Port Setting

Administrator can configure authentication manger port settings, This page allow user to configure authentication manger port settings

### 14.5.3 MAC-Based Local Account

Administrator can allow to add/edit/delete MAC-Based authentication local accounts, Setting “add” and “Edit” and “Delete” function for this management.

Field	Description
MAC Address	Authenticated host MAC address, and each MAC allow only one entry in local database.
Control	Control Type <ul style="list-style-type: none"> <li>• <b>Force Authorized:</b> Host will be force authorized.</li> <li>• <b>Force Unauthorized:</b> Host will be force unauthorized.</li> </ul>
VLAN	Assigned VLAN ID for the authenticated host.
Timeout	<ul style="list-style-type: none"> <li>• <b>Reauthentication:</b> Assigned reauthentication period for the authenticated host.</li> <li>• <b>Inactive:</b> Assigned inactive timeout for the authenticated host.</li> </ul>

**Add MAC-Based Local Account**

<b>MAC Address</b>	<input type="text" value="8C:4D:EA:FE:05:BE"/>		
<b>Port Control</b>	<input type="radio"/> Force Authorized <input checked="" type="radio"/> Force Unauthorized		
<b>VLAN</b>	<input checked="" type="checkbox"/> User Defined <input type="text" value="1"/> (1 - 4094)		
<b>Assigned Timer</b>			
<b>Reauthentication</b>	<input checked="" type="checkbox"/> User Defined <input type="text" value="3600"/> Sec (300 - 2147483647)		
<b>Inactive</b>	<input checked="" type="checkbox"/> User Defined <input type="text" value="60"/> Sec (60 - 65535)		

- **MAC Address** : Authenticated host MAC address, and each MAC allow only one entry in local database.
- **Port Control** : Support following authentication port control types.
  - **Force Authorized**: Host will be force authorized.
  - **Force Unauthorized** : Host will be force unauthorized.
- **VLAN** : Assigned VLAN ID for the authenticated host.
- **Assigned Timer**:
  - **Timeout (Reauthentication)** : Assigned reauthentication period for the authenticated host.
  - **Timeout (Inactive)** : Assigned inactive timeout for the authenticated host.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.5.4 WEB-Based Local Account

Administrator can allow to add/edit/delete WEB-Based authentication local accounts, Setting “add” and “Edit” and “Delete” function for this management.

Field	Description
Username	Authenticating account user name
VLAN	Assigned VLAN ID for the authenticated host.
Timeout(Sec)	<ul style="list-style-type: none"> <li>• <b>Reauthentication:</b> Assigned reauthentication period for the authenticated host.</li> <li>• <b>Inactive:</b> Assigned inactive timeout for the authenticated host.</li> </ul>

**Add WEB-Based Local Account**

<b>Username</b>	<input type="text" value="testguest"/>
<b>Password</b>	<input type="password" value="....."/>
<b>Confirm Password</b>	<input type="password" value="....."/>
<b>VLAN</b>	<input checked="" type="checkbox"/> User Defined <input type="text" value="1"/> (1 - 4094)
<b>Assigned Timer</b>	
<b>Reauthentication</b>	<input checked="" type="checkbox"/> User Defined <input type="text" value="3600"/> Sec (300 - 2147483647)
<b>Inactive</b>	<input checked="" type="checkbox"/> User Defined <input type="text" value="60"/> Sec (60 - 65535)

- **Username** : Authenticating account user name.
- **Password** : Authenticating account password.
- **Confirm Password** : Confirm authenticating account password.
- **VLAN** : Assigned VLAN ID for the authenticated host.
- **Assigned Timer:**
  - **Timeout (Reauthentication)** : Assigned reauthentication period for the authenticated host.
  - **Timeout (Inactive)** : Assigned inactive timeout for the authenticated host.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 14.5.5 Sessions

Administrator can check all detail information of authentication sessions and allow user to select specific session to delete by clicking **“Clear”** button.

<p><b>Authorized</b></p>	<ul style="list-style-type: none"> <li>• <b>VLAN:</b> Shows VLAN ID given from authorized procedure.</li> <li>• <b>Reauthentication Period:</b> Shows reauthentication period given from authorized procedure.</li> <li>• <b>Inactive Timeouts:</b> Shows inactive timeout given from authorized procedure.</li> </ul>

Click the “**Clear**” button to clear this page or click the “**Refresh**” button to refresh the page .

## 14.6 Port Security

Port security examines all traffic received by secure ports to detect violations or to recognize and secure new MAC addresses. When the shutdown violation mode is configured, traffic cannot enter the secure port after a violation has been detected, which removes the possibility that violations might cause excessive CPU load.

Port security monitors received packets. Access to locked ports is limited to users with specific MAC addresses, This page allow user to configure port security settings for each interface. When port security is enabled on interface, action will be perform once MAC address over.

**Security → Port Security**

<input type="checkbox"/>	8	GE8	Disabled	1	0	0	0	Protect	Disabled
<input type="checkbox"/>	9	GE9	Disabled	1	0	0	0	Protect	Disabled
<input type="checkbox"/>	10	GE10	Disabled	1	0	0	0	Protect	Disabled

- **State:** Select the status of port security
  - **Disable:** Disable port security function.
  - **Enable:** Enable port security function.
- **Rate Limit :** Set rate limit of 1-600 packets per second.

**Note** When the protect or restrict violation modes are configured, port security continues to process traffic after a violation occurs, which might cause excessive CPU load. Configure the port security rate limiter to protect the CPU against excessive load when the protect or restrict violation modes are configured.

Click the **“Apply”** button to save your changes settings.

Field	Description
<b>Port</b>	Port name which the port security.
<b>State</b>	Display port security of Enable or Disable state.
<b>Address Limie</b>	Displays the maximum number of port security of MAC addresses that can be configured on the port.
<b>Total</b>	Displays the number of all port security total MAC addresses on the port.

<b>Configured</b>	Displays the number of all port security MAC addresses configured on the port.
<b>Violate Active</b>	<p>Displays the operational state that the interface applies to packets arriving on the locked interface.</p> <ul style="list-style-type: none"> <li>• <b>Protect.</b></li> <li>• <b>Restrict.</b></li> <li>• <b>Shutdown.</b></li> </ul>
<b>Sticky</b>	Display port security sticky of Enable or Disable.

- **Port:** Display selected Port number.
- **State:** Enable or Un-Enable the port security.
- **Address Limit:** When configuring port security, the maximum number of secure MAC addresses that can be configured in the switch, A secure port has a default of one MAC address. The default can be changed to any value between 1 and 256. The upper limit of 256 guarantees one MAC address per port.
- **Violate Action:** Select the action if learned mac addresses, If Interface Status is locked, select an action to be applied to packets arriving on a locked interface.
  - **Protect:** Drop packets with invalid MAC address.
  - **Restrict:** Drop packets with invalid MAC address and log the event.
  - **Shutdown:** Drop packets with invalid MAC address and shut down the interface of port, and log the event.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.7 Protected Port

This page allow user to configure protected port setting to prevent the selected ports from communication with each other. Protected port is only allowed to communicate with unprotected port. In other words, protected port is not allowed to communicate with another protected port. If administrators check enable to make this a protected port. A protected port is also referred as a Private VLAN Edge. It's provide Layer 2 isolation between interfaces (Ethernet ports and Link Aggregation Groups) that share the same Broadcast domain (VLAN).After enable protected port, packets received from protected ports can be forwarded only to unprotected egress ports and unrestricted by VLAN members.

<input type="checkbox"/>	Entry	Port	State

- **Port:** Display selected Port number.
- **State:** Port protected admin state.
  - **Protected:** Enable protecting function.
  - **Unprotected (deselect):** Disable protecting function

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.8 Storm Control

When the rate of Broadcast / unknown Multicast or unknown Unicast frames is higher than the user-defined threshold, this function can to limit the number of frames entering the switch and to define the types of frames that are counted towards this limit. Will be the frames received beyond the threshold are discarded or the interface shuts down.

- **State:** Select the state of setting.
  - **Enable:** Enable the storm control function.
- **Broadcast:** If enable storm control for Broadcast traffic will count Broadcast traffic towards the bandwidth threshold.
  - **Enable:** Enable the storm control function of Broadcast packet, Value of storm control rate, Unit: Kbps (Kbits per-second, range16 - 1000000) depends on global mode setting.
- **Unknown Multicast:** If enable storm control for unknown Multicast will count unknown Multicast traffic towards the bandwidth threshold.
  - **Enable:** Enable the storm control function of Unknown Multicast packet, Value of storm control rate, Unit: Kbps (Kbits per-second, range16 - 1000000) depends on global mode setting.
- **Unknown Unicast:** If enable storm control for unknown Unicast will count unknown Unicast traffic towards the bandwidth threshold.
  - **Enable:** Enable the storm control function of Unknown Unicast packet, Value of storm control rate, Unit: Kbps (Kbits per-second, range16 - 1000000) depends on global mode setting.
- **Action:** Administrator can select Drop or Shutdown will Broadcast / unknown Multicast or unknown Unicast frames is higher than the user-defined threshold.
  - **Drop:** Received beyond the threshold will discard the frames, Packets exceed storm control rate will be dropped
  - **Shutdown:** Received beyond the threshold will shut down the port, Port will be shutdown when packets exceed storm control rate.

Click the **"Apply"** button to save your changes or **"Close"** the button to close settings.

## 14.9 DoS

DoS attack (denial-of-service) is a cyber-attack where the perpetrator seeks to make a machine or network resource unavailable to its intended users by temporarily or indefinitely disrupting services of a host connected to the Internet. Denial of service is typically accomplished by flooding the targeted machine or resource with superfluous requests in an attempt to overload systems and prevent some or all legitimate requests from being fulfilled.

### 14.9.1 Property

This default is enabled all DoS protection feature and SYN-FIN / SYN-RST protections. The default threshold is 60 SYN packets per second. The default period of port recovery is 60 seconds.

POD	<input checked="" type="checkbox"/> Enable

Apply

- **POD:**
  - **Enable:** Enable the Dos attack of avoids ping of death attack function.
- **Land:**
  - **Enable:** Enable the Dos attack of drops the packets if the source IP address is equal to the destination IP address function.
- **UDP Blat:**
  - **Enable:** Enable the Dos attack of drops the packets if the UDP source port equals to the UDP destination port function.
- **TCP Blat:**
  - **Enable:** Enable the Dos attack of drops the packages if the TCP source port is equal to the TCP destination port function.
- **DMAC = SMAC:**
  - **Enable:** Enable the Dos attack of drops the packets if the destination MAC address is equal to the source MAC address function.
- **Null Scan Attack:**
  - **Enable:** Enable the Dos attack of drops the packets with NULL scan function.
- **X-Mas Scan Attack:**
  - **Enable:** Enable the Dos attack of drops the packets if the sequence number is zero, and the FIN, URG and PSH bits are set function.
- **TCP SYN-FIN Attack:**
  - **Enable:** Enable the Dos attack of drops the packets with SYN and FIN bits set function.
- **TCP SYN-RST Attack:**
  - **Enable:** Enable the Dos attack of drops the packets with SYN and RST bits set function.
- **ICMP Fragment:**
  - **Drop:** Enable the Dos attack of drops the fragmented ICMP packets function.
- **TCP- SYN (SPORT<1024):**
  - **Enable:** Enable the Dos attack of drops SYN packets with sport less than 1024 function.
- **TCP Fragment (Offset = 1):**
  - **Enable:** Enable the Dos attack of drops the TCP fragment packets with offset equals to one function.
- **Ping Max Size:**
  - **Enable:** Enable the Dos attack of specify the maximum size of the ICMPv4/ICMPv6 ping packets. The valid range is from 0 to 65535 bytes, and the default value is 512 bytes.
- **IPv4 Ping Max Size:**
  - **Enable:** Enable the Dos attack of checks the maximum size of ICMP ping packets, and drops the packets larger than the maximum packet size function.

- **IPv6 Ping Max Size:**
  - **Enable:** Enable the Dos attack of checks the maximum size of ICMPv6 ping packets, and drops the packets larger than the maximum packet size function.
- **TCP Min Hdr Size:**
  - **Enable:** Enable the Dos attack of checks the minimum TCP header and drops the TCP packets with the header smaller than the minimum size. The length range is from 0 to 31 bytes, and default length is 20 bytes function.
- **IPv6 Min Fragment:**
  - **Enable:** Enable the Dos attack of checks the minimum size of IPv6 fragments, and drops the packets smaller than the minimum size. The valid range is from 0 to 65535 bytes, and default value is 1240 bytes function.
- **Smurf Attack:**
  - **Enable:** Enable the Dos attack of avoids smurf attack. The length range of the netmask is from 0 to 323 bytes, and default length is 0 bytes function.

Click the **“Apply”** button to save your changes settings

## 14.9.2 Port Setting

Administrator can choose protected ports.

The screenshot shows a web-based configuration interface. On the left is a navigation menu with a tree structure. The 'Security' section is expanded, showing sub-items like RADIUS, TACACS+, AAA, Management Access, Authentication Manager, Port Security, Protected Port, Storm Control, DoS, Property, and Port Setting. The main content area is titled 'Port Setting Table' and contains a table with the following data:

<input type="checkbox"/>	Entry	Port	State
<input checked="" type="checkbox"/>	1	GE1	Disabled
<input checked="" type="checkbox"/>	2	GE2	Disabled
<input type="checkbox"/>	3	GE3	Disabled
<input type="checkbox"/>	4	GE4	Disabled
<input type="checkbox"/>	5	GE5	Disabled
<input type="checkbox"/>	6	GE6	Disabled
<input type="checkbox"/>	7	GE7	Disabled
<input type="checkbox"/>	8	GE8	Disabled
<input type="checkbox"/>	9	GE9	Disabled
<input type="checkbox"/>	10	GE10	Disabled
<input type="checkbox"/>	11	GE11	Disabled
<input type="checkbox"/>	12	GE12	Disabled
<input type="checkbox"/>	13	GE13	Disabled
<input type="checkbox"/>	14	GE14	Disabled
<input type="checkbox"/>	15	GE15	Disabled
<input type="checkbox"/>	16	GE16	Disabled

Field	Description
Port	Interface of port number.
State	Display Enable/Disable the DoS protection on the interface.

**Edit Port Setting**

---

Port: GE1-GE2

State:  Enable

Apply Close

- **Port:** Display selected Port number.
- **State:** Select the state of setting.
  - **Enable:** Enable the DoS protection function.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.10 Dynamic ARP Inspection

Dynamic Address Resolution Protocol (ARP) is a TCP/IP protocol for translating IP addresses into MAC addresses. Use the Dynamic ARP Inspection pages to configure settings of Dynamic ARP Inspection.

### 14.10.1 Property

This page allow user to configure global and per interface settings of Dynamic ARP Inspection.

**Security → Dynamic ARP Inspection → Property**

**Port Setting Table**

Entry	Port	Trust	Source MAC Address	Destination MAC Address	IP Address	Rate Limit
<input checked="" type="checkbox"/>	1	GE1	Disabled	Disabled	Disabled	Unlimited
<input checked="" type="checkbox"/>	2	GE2	Disabled	Disabled	Disabled	Unlimited
<input checked="" type="checkbox"/>	3	GE3	Disabled	Disabled	Disabled	Unlimited
<input type="checkbox"/>	4	GE4	Disabled	Disabled	Disabled	Unlimited

- **State:** Administrator can enable or disable this Dynamic ARP Inspection. Set checkbox to enable/disable Dynamic ARP Inspection function.
- **VLAN:** In the Enabled VLAN table, users assign static ARP Inspection lists to enabled VLANs. When a packet passes through an untrusted interface that is enabled for ARP Inspection switch will performs the checks, Select VLANs in left box then move to right to enable Dynamic ARP Inspection. Or select VLANs in right box then move to left to disable Dynamic ARP Inspection.

Click the **“Apply”** button to save your changes settings

Field	Description
Port	Port the port ID.
Trust	Display enable/disable trust attribute of interface.
Source MAC Address	Display enable/disable source mac address validation attribute of interface.
Destination MAC Address	Display enable/disable destination mac address validation attribute of interface.
IP Address	Display enable/disable IP address validation attribute of interface, Allow zero which means allow 0.0.0.0 IP address.
Rate Limit	Display rate limitation value of interface.

**Edit Port Setting**

Port	GE1-GE3
Trust	<input checked="" type="checkbox"/> Enable
Source MAC Address	<input checked="" type="checkbox"/> Enable
Destination MAC Address	<input checked="" type="checkbox"/> Enable
IP Address	<input checked="" type="checkbox"/> Enable <input type="checkbox"/> Allow Zero (0.0.0.0)
Rate Limit	<input type="text" value="50"/> pps (1 - 50, default 0), 0 is Unlimited

- **Port:** Display selected Port number.
- **Trust:** If enabled, the port or LAG is a trusted interface, and ARP inspection is not performed on the ARP requests or replies sent to or from the interface. If Un-Enable, the port or LAG is not a trusted interface, and ARP inspection is performed on the ARP requests or replies sent to or from the interface. By default, it is disabled.

- **Source MAC Address:** Check Enable to validate the source MAC addresses in ARP requests and replies, Set checkbox to enable or disable source mac address validation of interface. All ARP packets will be checked whether sender mac is same as source mac in Ethernet header if enable source mac address validation. Default is disabled.
- **Destination MAC Address:** Check Enable to validate the destination MAC addresses in ARP replies, Set checkbox to enable or disable destination mac address validation of interface. All ARP packets will be checked whether target mac is same as destination mac in Ethernet header if enable destination mac address validation. Default is disabled.
- **IP Address:** Set checkbox to enable or disable IP address validation of interface. All ARP packets will be checked whether IP address is 0.0.0.0,255.255.255.255 or multicast address. Default is disabled.
  - **Allow all-zeros IP:** If IP address validation is enabled, check Enable to allow 0.0.0.0 the IP address.
- **Rate Limit:** Enter the maximum rate that is allowed on the interface. The range is 1 to 50pps and the default is 0 Unlimited.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 14.10.2 Statistics

The Statistics page will displays the statistical information for ARP Inspection.

Entry	Port	Forward	Source MAC Failure	Destination MAC Failure	Source IP Validation Failure	Destination IP Validation Failure	IP-MAC Mismatch Failure
1	GE1	0	0	0	0	0	0
2	GE2	0	0	0	0	0	0
3	GE3	0	0	0	0	0	0
4	GE4	0	0	0	0	0	0
5	GE5	0	0	0	0	0	0
6	GE6	0	0	0	0	0	0
7	GE7	0	0	0	0	0	0

9	GE9	0	0	0	0	0	0
10	GE10	0	0	0	0	0	0
11	GE11	0	0	0	0	0	0
12	GE12	0	0	0	0	0	0
13	GE13	0	0	0	0	0	0
14	GE14	0	0	0	0	0	0
15	GE15	0	0	0	0	0	0

Field	Description
Port	Interface of port number.

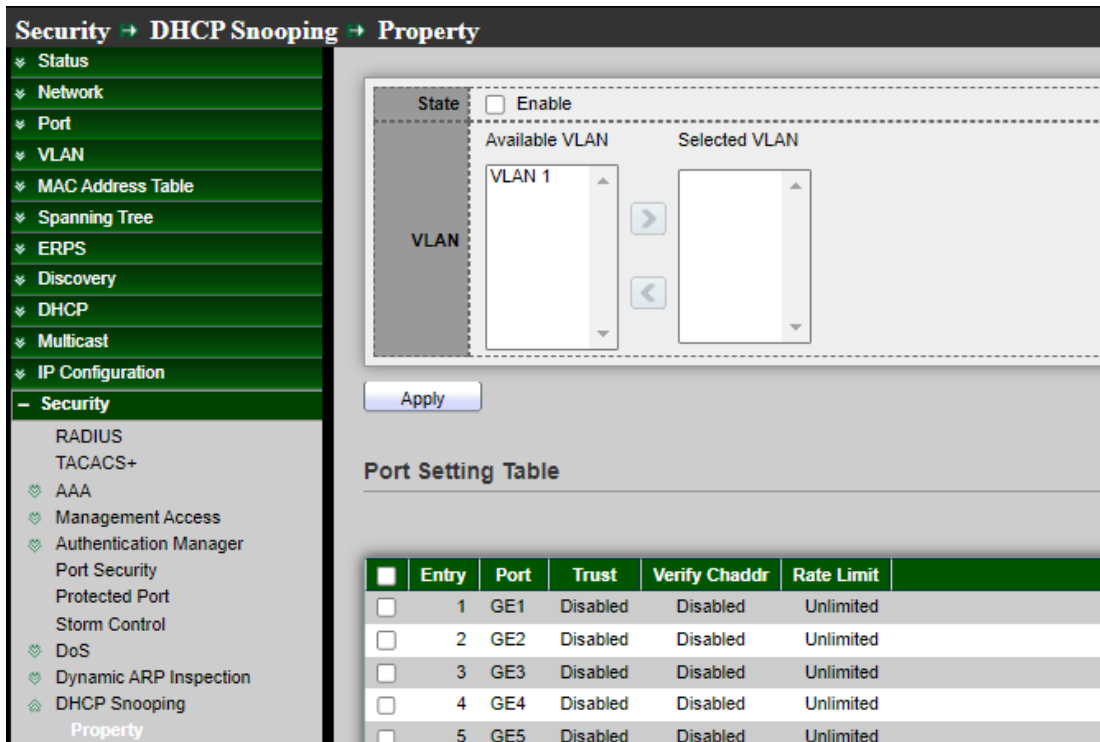

<b>Forward</b>	Display how many packets forwarded normally.
<b>Source MAC Failure</b>	Display how many packets dropped by source MAC validation.
<b>Destination MAC Failure</b>	Display how many packets dropped by destination MAC validation.
<b>Source IP Address Validation Failures</b>	Display how many packets dropped by source IP validation.
<b>Destination IP Address Validation Failures</b>	Display how many packets dropped by destination IP validation.
<b>IP-MAC Mismatch Failures</b>	Display how many packets dropped by IP-MAC doesn't match in IP Source Guard binding table.

## 14.11 DHCP Snooping

Administrator can use DHCP snooping to help avoid the Denial of Service attacks that result from unauthorized users adding a DHCP server to the network that then provides invalid configuration data to other DHCP clients on the network. DHCP packets received on other switch ports are inspected before being forwarded. Packets from untrusted sources are dropped.

### 14.11.1 Property

This page allow user to configure global and per interface settings of DHCP Snooping.

- **State:** Administrator can enable or Un-Enable DHCP Snooping, Set checkbox to enable/disable DHCP Snooping function.
- **VLAN:** Administrator can to enable DHCP Snooping on a VLAN, ensure that DHCP Snooping is globally enabled on the switch, Select VLANs in left box then move to right to enable DHCP Snooping. Or select VLANs in right box then move to left to disable DHCP Snooping.

Click the **“Apply”** button to save your changes settings.

Field	Description
Port	Interface of port number.
Trust	Display enable/disabled trust attribute of interface.
Verify Chaddr	Display enable/disabled chaddr validation attribute of interface.
Rate Limit	Display rate limitation value of interface.

**Edit Port Setting**

<b>Port</b>	GE1-GE3	
<b>Trust</b>	<input checked="" type="checkbox"/>	Enable
<b>Verify Chaddr</b>	<input checked="" type="checkbox"/>	Enable
<b>Rate Limit</b>	<input style="width: 80px;" type="text" value="45"/>	pps (1 - 300, default 0), 0 is Unlimited

- **Port:** Display selected Port number.
- **Trust:** If check Enable will connected to a DHCP server or to other switches or routers as trusted ports, Set checkbox to enable/disabled trust of interface. All DHCP packet will be forward directly if enable trust. Default is disabled
- **Verify Chaddr:** Set checkbox to enable or disable chaddr validation of interface. All DHCP packets will be checked whether client hardware mac address is same as source mac in Ethernet header if enable chaddr validation. Default is disabled.
- **Rate Limit:** Enter the maximum rate that is allowed on the interface. The range is 1 to 300pps and the default is 0 Unlimited.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 14.11.2 Statistics

<b>Type</b>	<input type="radio"/> None <input checked="" type="radio"/> Flash <input type="radio"/> TFTP
<b>Filename</b>	<input type="text"/>
<b>Address Type</b>	<input checked="" type="radio"/> Hostname <input type="radio"/> IPv4
<b>Server Address</b>	<input type="text"/>
<b>Write Delay</b>	<input type="text" value="300"/> Sec (15 - 86400, default 300)
<b>Timeout</b>	<input type="text" value="300"/> Sec (0 - 86400, default 300)

- **Type:** Administrator can select the type of database agent.
  - **None:** Disable database agent service.
  - **Flash:** Save DHCP dynamic binding entries to flash.
  - **TFTP:** Save DHCP dynamic binding entries to remote TFTP server.
- **Filename:** Set file name of TFTP server, Input filename for backup file. Only available when selecting type “flash” and “TFTP”.
- **Address Type:** Select use Host name or IP address to connection TFTP server.
  - **Hostname:** TFTP server address is hostname.
  - **IPv4:** TFTP server address is IPv4 address.
- **Server Address:** Input remote TFTP server hostname or IP address. Only available when selecting type “TFTP”.
- **Write Delay:** Input delay timer for doing backup after change happened. Default is 300 seconds.
- **Timeout:** Input aborts timeout for doing backup failure. Default is 300 seconds.

Click the **“Apply”** button to save your changes settings.

## 15. ACL

ACL (Access Control List) is an ordered list of classification filters and actions. Each single classification rule, together with its action, is called an Access Control Element (ACE). Each ACE is made up of filters that distinguish traffic groups and associated actions. A single ACL may contain one or more ACEs, which are matched against the contents of incoming frames. Either a DENY or PERMIT action is applied to frames whose contents match the filter.

<b>Note</b>	<p>When a packet matches an ACE filter, the ACE action is taken and that ACL processing is stopped. If the packet does not match the ACE filter, the next ACE is processed. If all ACEs of an ACL have been processed without finding a match, and if another ACL exists, it is processed in a similar manner.</p> <p>If no match is found to any ACE in all relevant ACLs then ACL default action will dropped the packet.</p>
-------------	---

### 15.1 MAC ACL

This page mainly creates MAC ACLs profile. The MAC ACLs are used to filter traffic based on Layer 2 fields and defined on the MAC ACE page.

This page allow user to add or delete ACL rule. A rule cannot be deleted if under binding.

<b>Note</b>	<p>A port can be either secured with ACLs or configured with advanced QoS policy, but not both.</p>
-------------	---

The screenshot shows a web interface for configuring ACLs. On the left is a navigation menu with 'ACL → MAC ACL' selected. The main area contains an 'ACL Name' input field, an 'Apply' button, and an 'ACL Table' section. The table shows one entry: 'testACL' with '0' rules. A 'Delete' button is located below the table.

ACL Name	Rule	Port
testACL	0	

- **ACL Name:** Create a name of ACL.

Click the **“Apply”** button to save your changes settings.

Field	Description
ACL Name	Display MAC ACL name.
Rule	Display the number ACE rule of ACL..
Port	L Display the port list that bind this ACL.

Click the **“Delete”** button to delete ACL table list.

## 15.2 MAC ACE

MAC ACE will check all frames for a match. Setting **“add”** and **“Edit”** and **“Delete”** for this function management, This page allow user to add, edit or delete ACE rule. An ACE rule cannot be edited or deleted if ACL under binding. New ACE cannot be added if ACL under binding .

- **ACL Name:** Select the ACL name to which an ACE is being added.

Field	Description
Sequence	Display the sequence of ACE.

<b>Action</b>	Display the action of ACE
<b>Source MAC</b>	Display the source MAC address and mask of ACE.
<b>Destination MAC</b>	Display the destination MAC address and mask of ACE.
<b>Ethertype</b>	Display the Ethernet frame type of ACE.
<b>VLAN ID</b>	Display the VLAN ID of ACE
<b>802.1p Value</b>	Display the 802.1p value of ACE.
<b>802.1p Mask</b>	Display the 802.1p mask of ACE.

**Add ACE**

<b>ACL Name</b>	testACL
<b>Sequence</b>	<input type="text" value="2"/> (1 - 2147483647)
<b>Action</b>	<input checked="" type="radio"/> Permit <input type="radio"/> Deny <input type="radio"/> Shutdown
<b>Source MAC</b>	<input checked="" type="checkbox"/> Any <input type="text"/> / <input type="text"/> (Address / Mask)
<b>Destination MAC</b>	<input checked="" type="checkbox"/> Any <input type="text"/> / <input type="text"/> (Address / Mask)
<b>Ethertype</b>	<input checked="" type="checkbox"/> Any 0x <input type="text"/> (0x600 ~ 0xFFFF)
<b>VLAN</b>	<input checked="" type="checkbox"/> Any <input type="text"/> (1 - 4094)
<b>802.1p</b>	<input checked="" type="checkbox"/> Any <input type="text"/> / <input type="text"/> (Value / Mask) (0 - 7)

- **ACL Name:** Display the ACL name to which an ACE is being added.
- **Sequence:** ACEs with higher sequence are processed first (1 is the highest priority). Only available on Add Dialog.
- **Action:** Administrator can select the action after ACE match packet.

- **Permit:** Forward packets that meet the ACE criteria.
- **Deny:** Drop packets that meet the ACE criteria.
- **Shutdown:** Drop packets that meet the ACE criteria, and disable the port from where the packets were received. Such ports can be reactivated from the Port Settings page.
- **Source MAC:** Select the type for source MAC address.
  - **Any:** All source addresses are acceptable.
  - **User Defined:** Only a source address or a range of source addresses which users define are acceptable. Enter the source MAC address and mask to which will be matched.
- **Destination MAC:** Destination MAC Select the type for Destination MAC address.
  - **Any:** All destination addresses are acceptable.
  - **User Defined:** Only a destination address or a range of destination addresses which users define are acceptable. Enter the destination MAC address and mask to which will be matched.

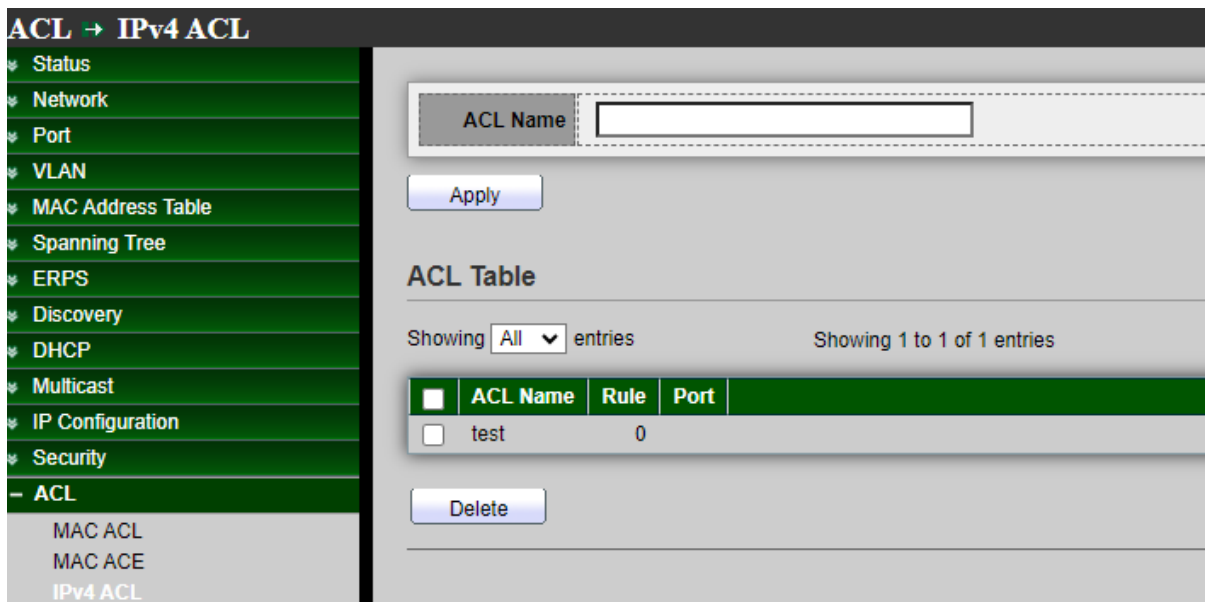

<b>Note</b>	Set F is show value, 0 is mask value, E.g. If an MAC is 8C:4D:EA:11:22:33 the mask value FF:FF:FF:00:00:00 indicates that only the first three bytes of the destination MAC address are used(8C:4D:EA).
-------------	---

- **Ethertype:** Select the type for Ethernet frame type.
  - **Any:** All Ethernet frame type is acceptable.
  - **User Defined:** Only an Ethernet frame type which users define is acceptable. Enter the Ethernet frame type value to which will be matched.
- **VLAN ID:** Select the type for VLAN ID.
  - **Any:** All VLAN ID is acceptable.
  - **User Defined:** User Defined: Only a VLAN ID which users define is acceptable. Enter the VLAN ID to which will be matched.
- **802.1p:** Select the type for 802.1p value.
  - **Any:** All 802.1p value is acceptable.
  - **User Defined:** User Defined: Only an 802.1p value or a range of 802.1p value which users define is acceptable. Enter the 802.1p value and mask to which will be matched.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 15.3 IPv4 ACL

Mainly creates IPv4 ACLs profile. The IPv4 ACLs are used to check IPv4 packets, This page allow user to add or delete Ipv4 ACL rule. A rule cannot be deleted if under binding.

➤ **ACL Name:** Create a name of ACL.

Click the **“Apply”** button to save your changes settings.

Field	Description
ACL Name	Display IPv4 ACL name
Rule	Display the number ACE rule of ACL
Port	Display the port list that bind this ACL

Click the **“Delete”** button to delete the table list.

## 15.4 IPv4 ACE

This page allow user to add, edit or delete ACE rule. An ACE rule cannot be edited or deleted if ACL under binding. New ACE cannot be added if ACL under binding, Setting **“add”** and **“Edit”** and **“Delete”** for this function management.

- **Source Port:** Select the type of protocol for a match. Only available when protocol is TCP or UDP.
  - **Any:** All source ports are acceptable.
  - **Single:** Enter a single TCP/UDP source port to which packets are matched.
  - **Range:** Select a range of TCP/UDP source ports to which the packet is matched. There are eight different port ranges that can be configured (shared between source and destination ports). TCP and UDP protocols each have eight port ranges.
- **Destination Port:** Select the type of protocol for a match. Only available when protocol is TCP or UDP.
  - **Any:** All source ports are acceptable.
  - **Single:** Enter a single TCP/UDP source port to which packets are matched.
  - **Range:** Select a range of TCP/UDP destination ports to which the packet is matched. There are eight different port ranges that can be configured (shared between source and destination ports). TCP and UDP protocols each have eight port ranges.
- **TCP Flags:** Select one or more TCP flags with which to filter packets. Filtered packets are either forwarded or dropped. Filtering packets by TCP flags increases packet control, which increases network security. Only available when protocol is TCP.

- **Set:** Match if the flag is SET.
- **Unset:** Match if the flag is Not SET.
- **Don't care:** Ignore the TCP flag.
- **ICMP Type:** Either select the message type by name or enter the message type number. Only available when protocol is ICMP.
  - **Any:** All message types are acceptable.
  - **Select from list:** Select message type by name.
  - **Protocol ID to match:** Enter the number of message type.
- **ICMP Code:** Select the type for ICMP code. Only available when protocol is ICMP.
  - **Any:** All codes are acceptable.
  - **User Defined:** Enter an ICMP code to match.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 15.5 IPv6 ACL

Mainly creates IPv6 ACLs profile. The IPv6 ACLs are used to check IPv6 packets, This page allow user to add or delete Ipv6 ACL rule. A rule cannot be deleted if under binding.

- **ACL Name:** Create a name of ACL.

Click the **“Apply”** button to save your changes settings.

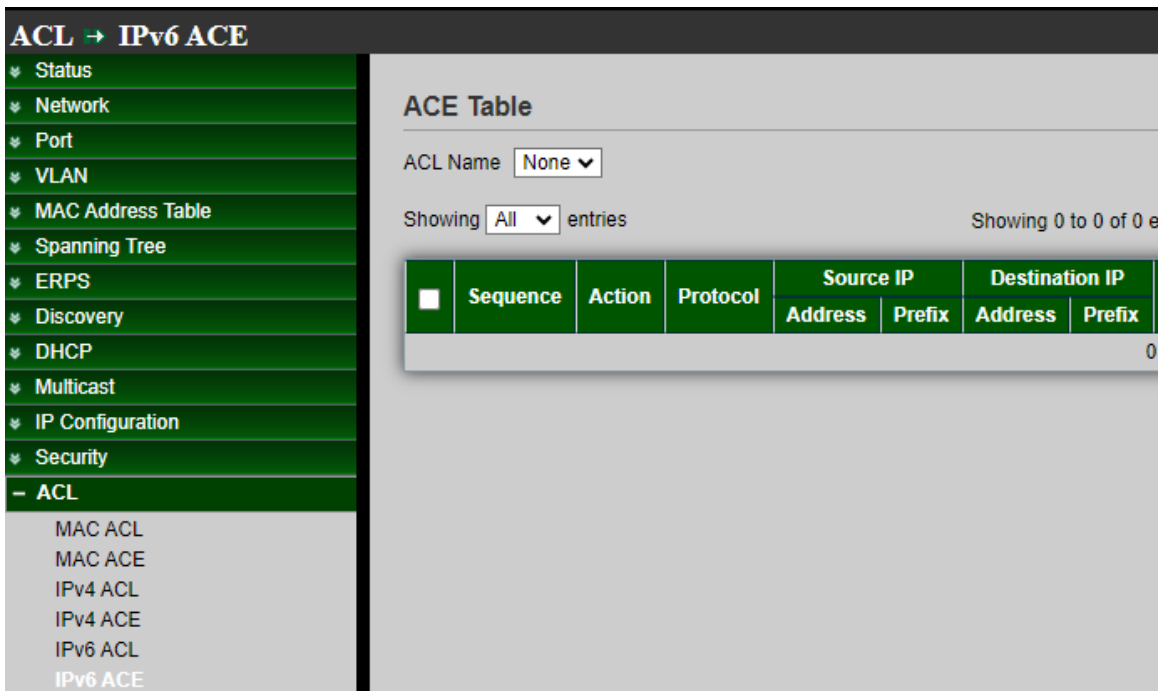

Field	Description
ACL Name	Display IPv6 ACL name
Rule	Display the number ACE rule of ACL
Port	Display the port list that bind this ACL

Click the **“Delete”** button to delete the table list.

## 15.6 IPv6 ACE

This page allow user to add, edit or delete ACE rule. An ACE rule cannot be edited or deleted if ACL under binding. New ACE cannot be added if ACL under binding, Setting **“add”** and **“Edit”** and **“Delete”** for this function management.

  - **Any:** All message types are acceptable.
  - **Select from list:** Select message type by name.
  - **Protocol ID to match:** Enter the number of message type.
- **ICMP Code:** Select the type for ICMP code. Only available when protocol is ICMP.
  - **Any:** All codes are acceptable.
  - **User Defined:** Enter an ICMP code to match.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 15.7 ACL Binding

This page allow user to bind or unbind ACL rule to or from interface. IPv4 and Ipv6 ACL cannot be bound to the same port simultaneously , Administrator can from ACL Binding Table to select ports. When an ACL is bound to an interface, its ACE rules are applied to packets arriving at that interface. Packets that do not match any of the ACEs in the ACL are matched to a default rule, whose action is to drop unmatched packets.

**ACL → ACL Binding**

- **IPv4 ACL:** IPv4 ACLs that are bound to the interface, Select IPv4 ACL name from list to bind.
- **IPv6 ACL:** IPv6 ACLs that are bound to the interface, Select IPv6 ACL name from list to bind.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 16. QoS

The quality of service (QoS) feature is applied throughout the network to ensure that network traffic is prioritized according to required criteria and the desired traffic receives preferential treatment.

### 16.1 Property

The QoS feature is used to optimize network performance, Use the QoS general pages to configure settings for general purpose

**QoS → General → Property**

- **State:** Administrator can enable or disable this QoS Feature.
- **Trust Mode:** Administrator can select CoS / DSCP / CoS-DSCP and IP Precedence mode.
  - **CoS:** Traffic is mapped to queues based on the CoS field in the VLAN tag, or based on the per-port default CoS value (if there is no VLAN tag on the incoming packet), the actual mapping of the CoS to queue can be configured on port setting dialog.
  - **DSCP:** All IP traffic is mapped to queues based on the DSCP field in the IP header. The actual mapping of the DSCP to queue can be configured on the DSCP mapping page. If traffic is not IP traffic, it is mapped to the best effort queue..
  - **CoS-DSCP:** Select to use Trust CoS mode for non-IP traffic and Trust DSCP mode for IP traffic.
  - **IP Precedence:** Traffic is mapped to queues based on the IP precedence. The actual mapping of the IP precedence to queue can be configured on the IP Precedence mapping page.

Click the **“Apply”** button to save your changes settings.

Field	Description
<b>Port</b>	Interface of port name.
<b>CoS</b>	Port default CoS priority value for the selected ports.

<b>Trust</b>	<p>Port trust state:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Traffic will follow trust mode in global setting.</li> <li>• <b>Disabled:</b> Traffic will always use best efforts.</li> </ul>
<b>Remarking (CoS)</b>	<p>Remarking (CoS) Port CoS remarking admin state:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> CoS remarking is enabled.</li> <li>• <b>Disabled:</b> CoS remarking is disabled.</li> </ul>
<b>Remarking (DSCP)</b>	<p>Port DSCP remarking admin state:</p> <ul style="list-style-type: none"> <li>• <b>Enabled:</b> DSCP remarking is enabled.</li> <li>• <b>Disabled:</b> DSCP remarking is disabled.</li> </ul>

- **Port:** Displays selected port number.
- **CoS:** Set default CoS/802.1p priority value for the selected ports, Set the default CoS value to be assigned for incoming packets (that do not have a VLAN tag). The range is 0 to 7.
- **Trust:** Set checkbox to enable/disable port trust state.
- **Remarking:**
  - **CoS:** Set checkbox to enable/disable port CoS remarking, Traffic is mapped to queues based on the VPT field in the VLAN tag, or based on the per-port default CoS value (if there is no VLAN tag on the incoming packet), the actual mapping of the VPT to queue can be configured on the CoS to Queue page.
  - **DSCP:** Set checkbox to enable/disable port DSCP remarking, All IP traffic is mapped to queues based on the DSCP field in the IP header. The actual mapping of the DSCP to queue can be configured on the DSCP to Queue page. If traffic is not IP traffic, it is mapped to the best effort queue.
  - **IP Precedence:** Set checkbox to enable/disable port IP Precedence remarking, Traffic is mapped to queues based on the IP precedence. The actual mapping of the IP precedence to queue can be configured on the IP Precedence to Queue page.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 16.2 Queue Scheduling

The switch supports eight queues for each interface. Queue number 8 is the highest priority queue. Queue number 1 is the lowest priority queue. There are two ways of determining how traffic in queues is handled, Strict Priority (SP) and Weighted Round Robin (WRR).

- Strict Priority (SP)—Egress traffic from the highest priority queue is transmitted first. Traffic from the lower queues is processed only after the highest queue has been transmitted, which provide the highest level of priority of traffic to the highest numbered queue.
- Weighted Round Robin (WRR)—In WRR mode the number of packets sent from the queue is proportional to the weight of the queue (the higher the weight, the more frames are sent).

The queuing modes can be selected on the Queue page. When the queuing mode is by Strict Priority, the priority sets the order in which queues are serviced, starting with queue\_8 (the highest priority queue) and going to the next lower queue when each queue is completed.

When the queuing mode is Weighted Round Robin, queues are serviced until their quota has been used up and then another queue is serviced. It is also possible to assign some of the lower queues to WRR, while keeping some of the higher queues in Strict Priority. In this case traffic for the SP queues is always sent before traffic from the WRR queues. After the SP queues have been emptied, traffic from the WRR queues is forwarded. (The relative portion from each WRR queue depends on its weight).

## 16.3 CoS Mapping

The CoS to Queue table determines the egress queues of the incoming packets based on the 802.1p priority in their VLAN tags. For incoming untagged packets, the 802.1p priority will be the default CoS/802.1p priority assigned to the ingress ports. Use the Queues to CoS table to remark the CoS/802.1p priority for egress traffic from each queue.

## 16.4 DSCP Mapping

The DSCP to Queue table determines the egress queues of the incoming IP packets based on their DSCP values. The original VLAN Priority Tag (VPT) of the packet is unchanged.

This DSCP values range from 0 through 63, whereas the internal forwarding priority values range from 1 through 8. Any DSCP value within a given range is mapped to the same internal forwarding priority value. These include the CS (Class Selector), AF (Assured Forwarding) and EF (Expedited Forwarding). For example, a packet with a DSCP tag value of 1 can be assigned to the High queue.

Use the Queues to DSCP page to remark DSCP value for egress traffic from each queue.

## 16.5 IP Precedence to Queue Mapping

This page allow user to configure IP Precedence to Queue mapping and Queue to IP Precedence mapping , The IP Precedence standard uses the first 3 bits of the ToS byte to mark packets with 8 levels of priority, numbered 0-7, with 0 being the lowest priority and 7 the highest. Because IP Precedence and ToS use different bits in the ToS byte to mark the priority of a packet, they can co-exist in the same packet header without interfering with each other.

## 16.6 Rate Limit

This page allow user to configure ingress port rate limit and egress port rate limit. The ingress rate limit is the number of bits per second that can be received from the ingress interface. Excess bandwidth above this limit is discarded.

## 16.6.1 Ingress / Egress Port

The rate limiting function can be configured to limit of Ingress/Egress traffic on a particular interface.

Administrator can set Ingress/Egress rate limiting in Ports. The usage rate is 16 to 10000000 Kbps

**QoS → Rate Limit → Ingress / Egress Port**

  - **Enable:** Enable/Disable the global logging services.
- **Aggregation:**
  - **Enable:** Enable/Disable the aggregation services.
  - **Aging:** 15~3600 Second. The default is 300 second.
- **Console Logging:**
  - **State:** Enable/Disable the Console Logging services.
  - **Minimum Severity:** The minimum severity for the Console Logging. Including selection of events such as Emergency, Alert, Critical, Error, Warning, Notice, Information, Debug, etc.
- **RAM Logging:**
  - **State:** Enable/Disable the RAM Logging services.
  - **Minimum Severity:** The minimum severity for the RAM logging. Including selection of events such as Emergency, Alert, Critical, Error, Warning, Notice, Information, Debug, etc.
- **Flash Logging:**
  - **State:** Enable/Disable the Flash Logging services.
  - **Minimum Severity:** The minimum severity for the flash logging. Including selection of events such as Emergency, Alert, Critical, Error, Warning, Notice, Information, Debug, etc.

<b>Note</b>	<ul style="list-style-type: none"> <li>• Emergency—System is not usable.</li> <li>• Alert—Action is needed.</li> <li>• Critical—System is in a critical condition.</li> <li>• Error—System is in error condition.</li> <li>• Warning—System warning has occurred.</li> <li>• Notice—System is functioning properly, but a system notice has occurred.</li> <li>• Informational—Device information.</li> <li>• Debug—Detailed information about an event.</li> </ul>
-------------	---

Click the **“Apply”** button to save your changes settings.

### 17.1.2 Remote Server

Use the Remote Log Servers page to define the remote SYSLOG servers where log messages are sent (using the SYSLOG protocol). For each server, you can configure the severity of the messages that it receives, Setting **“add”** and **“Edit”** and **“Delete”** for this function management.

**Diagnostics → Logging → Remote Server**

- Status
- Network
- Port
- VLAN
- MAC Address Table
- Spanning Tree
- ERPS
- Discovery
- DHCP
- Multicast
- IP Configuration
- Security
- ACL
- QoS
- Diagnostics**
  - Logging
    - Property
    - Remote Server

### Remote Server Table

<input type="checkbox"/>	Entry	Server Address	Server Port	Facility	Minimum Severity
<input type="checkbox"/>	1	192.168.2.99	514	Local 7	Alert

Field	Description
<b>Server Address</b>	The IP address of the remote logging server.
<b>Server Ports</b>	The port number of the remote logging server.
<b>Facility</b>	The facility of the logging messages. It can be one of the following values: local0, local1, local2, local3, local4, local5, local6, and l7.
<b>Minimum Severity</b>	<p>The minimum severity.</p> <ul style="list-style-type: none"> <li><b>Emergency:</b> System is not usable.</li> <li><b>Alert:</b> Immediate action is needed.</li> <li><b>Critical:</b> System is in the critical condition.</li> <li><b>Error:</b> System is in error condition.</li> <li><b>Warning:</b> System warning has occurred.</li> <li><b>Notice:</b> System is functioning properly, but a system notice has occurred.</li> <li><b>Informational:</b> Device information.</li> <li><b>Debug:</b> Provides detailed information about an event.</li> </ul>

**Add Remote Server**

<b>Address Type</b>	<input type="radio"/> Hostname <input checked="" type="radio"/> IPv4 <input type="radio"/> IPv6
<b>Server Address</b>	<input type="text" value="192.168.2.101"/>
<b>Server Port</b>	<input type="text" value="514"/> (1 - 65535, default 514)
<b>Facility</b>	<input type="text" value="Local 7"/> ▼
<b>Minimum Severity</b>	<input type="text" value="Warning"/> ▼

Note: Emergency, Alert, Critical, Error, Warning

- **Address Type:** Administrator can select use Hostname or IPv4/6 connection remote log server.
- **Server Address:** Enter the IP address of the server.
- **Server Port:** Enter service port to which the log messages are sent.
- **Facility:** Select a facility from which system logs are sent to the remote server. Only one facility can be assigned to a server.
- **Minimum Severity:** Select the minimum level of system log messages to be sent to the server.
  - **Emergency:** System is not usable.
  - **Alert:** Immediate action is needed.
  - **Critical:** System is in the critical condition.
  - **Error:** System is in error condition.
  - **Warning:** System warning has occurred.
  - **Notice:** System is functioning properly, but a system notice has occurred.
  - **Informational:** Device information.
  - **Debug:** Provides detailed information about an event..

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 17.2 Mirroring

Mirroring function can mirror Rx/Tx traffic, Packet can mirror to destination port and for analysis.

Session ID	State	Monitor Port	Ingress Port	Egress Port
1	Disabled	---	---	---
2	Enabled	GE3 (Normal*)	GE4	GE6
3	Disabled	---	---	---
4	Disabled	---	---	---

\*\*\* Allow the monitor port to send or receive normal packets

Field	Description
<b>Session ID</b>	Select mirror session ID
<b>State</b>	Select mirror session state : port-base mirror or disable <ul style="list-style-type: none"> <li>• <b>Enabled:</b> Enable port based mirror</li> <li>• <b>Disabled:</b> Disable mirror.</li> </ul>
<b>Monitor Port</b>	Select mirror session monitor port, and select whether normal packet could be sent or received by monitor port.
<b>Ingress port</b>	Select mirror session source rx ports
<b>Egress ports</b>	Select mirror session source tx ports

Click the **“Edit”** button to edit your settings.

**Edit Mirroring**

<b>Session ID</b>	2	
<b>State</b>	<input checked="" type="checkbox"/> Enable	
<b>Monitor Port</b>	GE2	
	<input checked="" type="checkbox"/> Send or Receive Normal Packet	
<b>Ingress Port</b>	Available Port	Selected Port
	<ul style="list-style-type: none"> <li>GE1</li> <li>GE2</li> <li>GE4</li> <li>GE5</li> <li>GE6</li> <li>GE7</li> <li>GE8</li> <li>GE9</li> </ul>	GE3
<b>Egress Port</b>	Available Port	Selected Port
	<ul style="list-style-type: none"> <li>GE1</li> <li>GE2</li> <li>GE5</li> <li>GE6</li> <li>GE7</li> <li>GE8</li> <li>GE9</li> <li>GE10</li> </ul>	GE3 GE4

- **Session ID:** Display selected mirror session ID.
- **State:**
  - **Enable:** Enable/Disable the mirroring function.
- **Mirroring Port:** Administrator can choose a mirroring Port.
- **Ingress Port:** Administrator can choose mirrored ports for ingress.
- **Egress Port:** Administrator can choose mirrored ports for egress

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 17.3 Ping

The Ping utility tests if a remote host can be reached and measures the round-trip time for packets sent from the device to a destination device.

Ping operates by sending Internet Control Message Protocol (ICMP) echo request packets to the target host and waiting for an ICMP response, sometimes called a pong. It measures the round-trip time and records any packet loss, Administrators can use this ping function to check connected device whether is active. This ping function support IPv4 and IPv6 protocol.

Diagnostics → Ping

- ▼ Status
- ▼ Network
- ▼ Port
- ▼ VLAN
- ▼ MAC Address Table
- ▼ Spanning Tree
- ▼ ERPS
- ▼ Discovery
- ▼ DHCP
- ▼ Multicast

- + Logging
  - Property
  - Remote Server
  - Mirroring
  - Ping
  - Traceroute
  - Copper Test
  - Fiber Module
- + UDLD
- + Management

Address Type
 Hostname
  IPv4
  IPv6

Server Address

Count
 (1 - 32)

### Ping Result

Packet Status	
Status	Success.
Transmit Packet	4
Receive Packet	4
Packet Lost	0 %

Round Trip Time	
Min	0 ms
Max	10 ms
Average	2 ms

- **Address Type:** Specify the address type to “Hostname”, “IPv6”, or “IPv4”.
- **Server Address:** Specify the Hostname/IPv4/IPv6 address for the remote logging server.
- **Count:** Specify the numbers of each ICMP ping request.

Click the “**Ping**” button to ping result appears.

Field	Description
<b>Packet Status</b>	Displays whether the ping succeeded or failed. <ul style="list-style-type: none"> <li><b>Status:</b> Displays the ping result status of “Success” or “Ping failed (timeout)”.</li> <li><b>Transmit Packet:</b> Number of packets sent by ping.</li> <li><b>Receive Packet:</b> Number of packets received by ping.</li> <li><b>Packet Lost:</b> Percentage of packets lost in ping process.</li> </ul>
<b>Round Trip Time</b>	Displays the ping <b>round trip time</b> . <ul style="list-style-type: none"> <li><b>Min:</b> Shortest time for packet to return.</li> <li><b>Max:</b> Longest time for packet to return.</li> <li><b>Average:</b> Average time for packet to return</li> </ul>

## 17.4 Traceroute

Traceroute discovers the IP routes along which packets were forwarded by sending an IP packet to the target host and back to the switch. The Traceroute page displays each hop between the switch and a target host and the round-trip time to each hop.

The screenshot shows the 'Diagnostics > Traceroute' configuration page. On the left is a navigation menu with categories like Status, Network, Port, VLAN, MAC Address Table, Spanning Tree, ERPS, Discovery, DHCP, Multicast, IP Configuration, Security, ACL, QoS, Diagnostics (expanded to show Logging, Property, Remote Server, Mirroring, Ping, Traceroute, Copper Test, Fiber Module, UDLD), and Management. The main area contains configuration fields: 'Address Type' with radio buttons for 'Hostname' (selected) and 'IPv4'; 'Server Address' with a text box containing '168.159.200.1'; and 'Time to Live' with a checked 'User Defined' checkbox and a text box containing '30' (with a note '(2 - 255, default 30)'). Below these are 'Apply' and 'Stop' buttons. The 'Traceroute Result' section displays the following output:

```

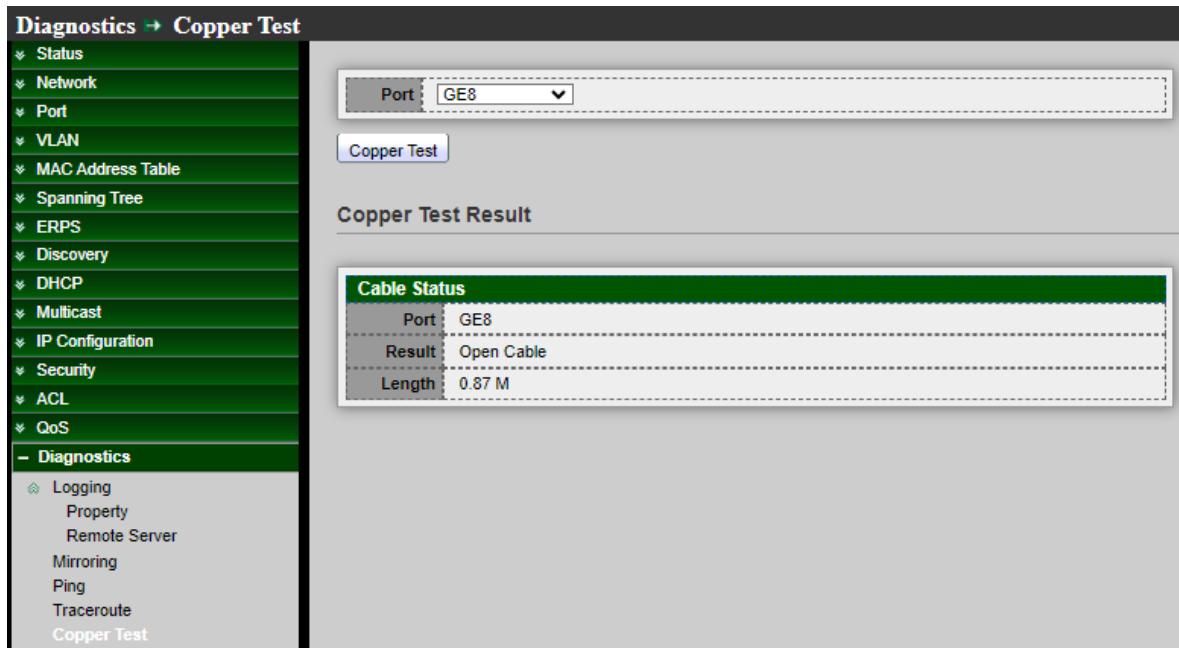

traceroute to 168.159.200.1 (168.159.200.1), 30 hops max, 38 byte packets
 1 192.168.101.254 (192.168.101.254) 0.000 ms 0.000 ms 0.000 ms
 2 60.248.167.254 (60.248.167.254) 0.000 ms 10.000 ms 10.000 ms
 3 168.95.81.206 (168.95.81.206) 10.000 ms 0.000 ms 0.000 ms
 4 220.128.2.6 (220.128.2.6) 0.000 ms 10.000 ms 0.000 ms
 5 * * *
 6 * * *
 7 * * *
 8 * * *
 9 * * *
10 * * *
11 * * *
12
    
```

- **Address Type:** Specify the address type to “Hostname”, or “IPv4”.
- **Server Address:** Specify the Hostname/IPv4 address for the remote logging server.
- **Time to Live :**Enter the maximum number of hops that Traceroute permits. This is used to prevent a case where the sent frame gets into an endless loop. The Traceroute command terminates when the destination is reached or when this value is reached. To use the default value (30), select Use Default.

Click the **“Apply”** button to Traceroute result appears.

## 17.5 Copper Test

Administrator can use this function check port Result whether is working, if working then display it.

Field	Description
Port	Specify the interface for the copper test.

Click the **“Copper Test”** button to Copper Test result appears.

### Cable Status

Field	Description
Port	The interface for the copper test.
Result	The status of copper test. It include: <ul style="list-style-type: none"> <li>• <b>OK:</b> Correctly terminated pair.</li> <li>• <b>Short Cable:</b> Shorted pair.</li> <li>• <b>Open Cable:</b> Open pair, no link partner.</li> <li>• <b>Impedance Mismatch:</b> Terminating impedance is not in the reference range.</li> <li>• <b>Line Drive:</b></li> </ul>
Length	Distance in meter from the port to the location on the cable where the fault was discovered.

## 17.6 Fiber Module

Display Fiber module messenger. The Optical Module Status page displays the operational information reported by the Small Form-factor Pluggable (SFP) transceiver. Some information may not be available for SFPs without the supports of digital diagnostic monitoring standard SFF-8472.

**Diagnostics → Fiber Module**

- ✦ Status
- ✦ Network
- ✦ Port
- ✦ VLAN
- ✦ MAC Address Table
- ✦ Spanning Tree
- ✦ ERPS
- ✦ Discovery
- ✦ DHCP

<input type="radio"/>	GE18	N/A	N/A	N/A	N/A	N/A	Remove	Loss
<input type="radio"/>	GE19	N/A	N/A	N/A	N/A	N/A	Remove	Loss
<input type="radio"/>	GE20	N/A	N/A	N/A	N/A	N/A	Remove	Loss
<input type="radio"/>	GE21	N/A	N/A	N/A	N/A	N/A	Remove	Loss
<input type="radio"/>	GE22	N/A	N/A	N/A	N/A	N/A	Remove	Loss
<input type="radio"/>	GE23	N/A	N/A	N/A	N/A	N/A	Remove	Loss
<input type="radio"/>	GE24	N/A	N/A	N/A	N/A	N/A	Remove	Loss

Field	Description
<b>Port</b>	Interface or port number.
<b>Temperature</b>	Internally measured transceiver temperature.
<b>Voltage</b>	Internally measured supply voltage.
<b>Current</b>	Measured TX bias current.
<b>Output Power</b>	Measured TX output power in mill watts.
<b>Input Power</b>	Measured RX received power in mill watts.
<b>Transmitter Fault</b>	State of TX fault.
<b>OE Present</b>	Indicate transceiver has achieved power up and data is ready.
<b>Loss of Signal</b>	Loss of signal.
<b>Refresh</b>	Refresh the page.
<b>Detail</b>	The detail information on the specified port.

Click the **“Refresh”** button to refresh this page or click the **“Detail”** button to check detail information.

## 17.7 UDLD

Uni-Directional Link Detection (UDLD) monitors a link between two devices and brings the ports on both ends of the link down if the link goes down at any point between the two devices, Use the UDLD pages to configure settings of UDLD function.

### 17.7.1 Property

This page allow user to configure global and per interface settings of UDLD.

Entry	Port	Mode	Bidirectional State	Operational Status	Neighbor
1	GE1	Disabled	Unknown		0
2	GE2	Disabled	Unknown		0
3	GE3	Disabled	Unknown		0
4	GE4	Disabled	Unknown		0
5	GE5	Disabled	Unknown		0
6	GE6	Disabled	Unknown		0
7	GE7	Disabled	Unknown		0
8	GE8	Disabled	Unknown		0
9	GE9	Disabled	Unknown		0
10	GE10	Disabled	Unknown		0
11	GE11	Disabled	Unknown		0
12	GE12	Disabled	Unknown		0
13	GE13	Disabled	Unknown		0
14	GE14	Disabled	Unknown		0

- **Message Time:** To use the UDLD protocol all connected switches and interfaces have to be configured for it. A UDLD configured switch sends UDLD advertisements, "hello" packets to its neighbors and expects to receive one in the designated hold time (the default hold time is 15mins). If this doesn't happen the UDLD disables the unresponsive interface..

Click the **“Apply”** button to save your changes settings.

Field	Description
Port	Display port ID of entry.
Mode	Display UDLD running mode of interface.
Bidirectional State	Display bidirectional state of interface.
Operational Status	Display operational status of interface
Neighbor	Display the number of neighbor of interface

- **Port:** Select one or multiple ports for the configure.
- **Mode:** Select UDLD running mode of interface.
  - **Disabled:** Disable UDLD function.
  - **Normal:** Running on normal mode that port goes to Link Up One phase after last neighbor ages out.
  - **Aggressive:** Running on aggressive mode that port goes to Re-Establish phase after last neighbor ages out.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 17.7.2 Neighbor

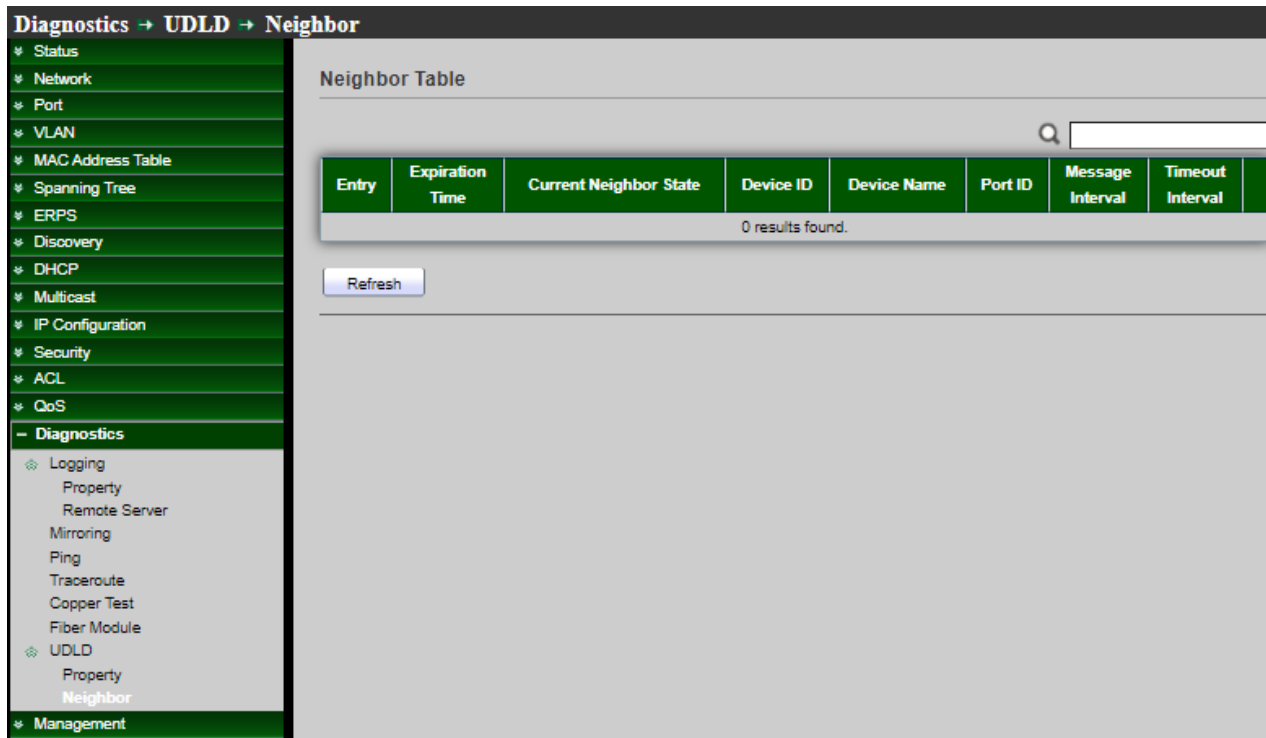

Each switch port that is configured for UDLD exchanges UDLD protocol packets that include information about the port's device and port ID, and the port also sends the same device and port ID information that it knows about its connected neighbor.

Because of this, a port should receive its own device and port ID information from its neighbor if the link is bi-directional. If a port does not receive information about its own device and port ID from its neighbor, the link is considered to be unidirectional.

This can occur when the link is up on both sides, but one side is not receiving packets, or when

wiring mistakes occur, causing the transmit and receive wires to not be connected to the same ports on both ends of a link.

Field	Description
<b>Entry</b>	Display entry index.
<b>Expiration Time</b>	Display expiration time before age out.
<b>Current Neighbor State</b>	Display neighbor current state
<b>Device ID</b>	Display neighbor device ID.
<b>Device Name</b>	Display neighbor device name.
<b>Port ID</b>	Display neighbor port ID that connected.
<b>Message Interval</b>	Display neighbor message interval.
<b>Timeout Interval</b>	Display neighbor timeout interval

## 18. Management

### 18.1 User Account

The default username/password is root/default. Administrator can modify login password or create new username / password and defined Privilege, Setting “add” and “Edit” and “Delete” function for this management.

**Management → User Account**

**User Account**

Showing All entries      Showing 1 to 3 of 3 entries

<input type="checkbox"/>	Username	Privilege
<input type="checkbox"/>	root	Admin
<input type="checkbox"/>	mis	Admin
<input type="checkbox"/>	number	User

First Previous 1 Next Last

Add Edit Delete

Field	Description
<b>Username</b>	User name of the account
<b>Privilege</b>	Display privilege level for new account. <ul style="list-style-type: none"> <li>• <b>Admin:</b> Allow to change switch settings. Privilege value equals to 15.</li> <li>• <b>User:</b> See switch settings only. Not allow to change it. Privilege level equals to 1.</li> </ul>

**Add User Account**

Username	<input type="text"/>
Password	<input type="password"/>
Confirm Password	<input type="password"/>
Privilege	<input checked="" type="radio"/> Admin <input type="radio"/> User

- **Username:** User name of the account.
- **Password:** Set password of the account.
- **Confirm Password:** Set the same password of the account as in “Password” field.
- **Privilege:** Select privilege level for new account.
  - **Admin:** Allow to change switch settings. Privilege value equals to 15.
  - **User:** See switch settings only. Not allow to change it. Privilege level equals to 1.

Click the “**Apply**” button to save your changes or “**Close**” the button to close settings.

## 18.2 Firmware

### 18.2.1 Upgrade / Backup

Administrator can upgrade or backup firmware, method can choose use TFTP or HTTP protocol. If choose backup then administrator can choose firmware image to backup.

**Management → Firmware → Upgrade / Backup**

<ul style="list-style-type: none"> <li>▼ Status</li> <li>▼ Network</li> <li>▼ Port</li> <li>▼ VLAN</li> <li>▼ MAC Address Table</li> <li>▼ Spanning Tree</li> <li>▼ ERPS</li> <li>▼ Discovery</li> <li>▼ DHCP</li> <li>▼ Multicast</li> <li>▼ IP Configuration</li> <li>▼ Security</li> <li>▼ ACL</li> <li>▼ QoS</li> <li>▼ Diagnostics</li> <li>▼ <b>Management</b> <ul style="list-style-type: none"> <li>User Account</li> <li>▼ Firmware               <ul style="list-style-type: none"> <li>Upgrade / Backup</li> <li>Active Image</li> </ul> </li> </ul> </li> </ul>	<table border="1"> <tr> <td>Action</td> <td> <input checked="" type="radio"/> Upgrade  <input type="radio"/> Backup         </td> </tr> <tr> <td>Method</td> <td> <input type="radio"/> TFTP  <input checked="" type="radio"/> HTTP         </td> </tr> <tr> <td>Filename</td> <td> <input type="button" value="Choose File"/> No file chosen         </td> </tr> </table> <p><input type="button" value="Apply"/></p>	Action	<input checked="" type="radio"/> Upgrade <input type="radio"/> Backup	Method	<input type="radio"/> TFTP <input checked="" type="radio"/> HTTP	Filename	<input type="button" value="Choose File"/> No file chosen

Method	<input type="radio"/> TFTP <input checked="" type="radio"/> HTTP						
Filename	<input type="button" value="Choose File"/> No file chosen						

- **Action:** Firmware operations.
  - **Upgrade:** Upgrade firmware from remote host to DUT.
  - **Backup:** Backup firmware image from DUT to remote host.

- **Method:** Firmware upgrade / backup method.
  - **TFTP:** Using TFTP to upgrade/backup firmware.
  - **HTTP:** Using WEB browser to upgrade/backup firmware.
- **Filename:** Use browser to upgrade firmware, you should select firmware image file on your host PC.

**Note** When the system is updated, the default value is upgrade always to Image1.

Click the **“Apply”** button to save your changes settings.

<b>Action</b>	<input type="radio"/> Upgrade <input checked="" type="radio"/> Backup
<b>Method</b>	<input checked="" type="radio"/> TFTP <input type="radio"/> HTTP
<b>Firmware</b>	<input checked="" type="radio"/> Image
<b>Address Type</b>	<input checked="" type="radio"/> Hostname <input type="radio"/> IPv4 <input type="radio"/> IPv6
<b>Server Address</b>	<input type="text"/>
<b>Filename</b>	<input type="text"/>

- **Action:** Firmware operations.
  - **Upgrade:** Upgrade firmware from remote host to DUT.
  - **Backup:** Backup firmware image from DUT to remote host.
- **Method:** Firmware upgrade / backup method.
  - **TFTP:** Using TFTP to upgrade/backup firmware.
  - **HTTP:** Using WEB browser to upgrade/backup firmware.
- **Firmware:** Firmware image in default flash.
- **Address Type:** Specify TFTP server address type
  - **Hostname:** Use domain name as server address.
  - **IPv4:** Use IPv4 as server address.
  - **IPv6:** Use IPv6 as server address
- **Server Address:** Specify TFTP server address.
- **Filename:** Firmware image file name on remote TFTP server.

Click the **“Apply”** button to save your changes settings.

## 18.2.2 Active Image

This page allows user to select firmware image on next booting and show firmware information on both flash partitions, If the Switch has upload multiple firmware in system then administrator can choose a firmware to do system default start.

- **Active Image:** Select firmware image to use on next booting.
  - **Image0:** Select the flash partition 0 for Firmware image0 to active.
  - **Image1:** Select the flash partition 1 for Firmware image1 to active.

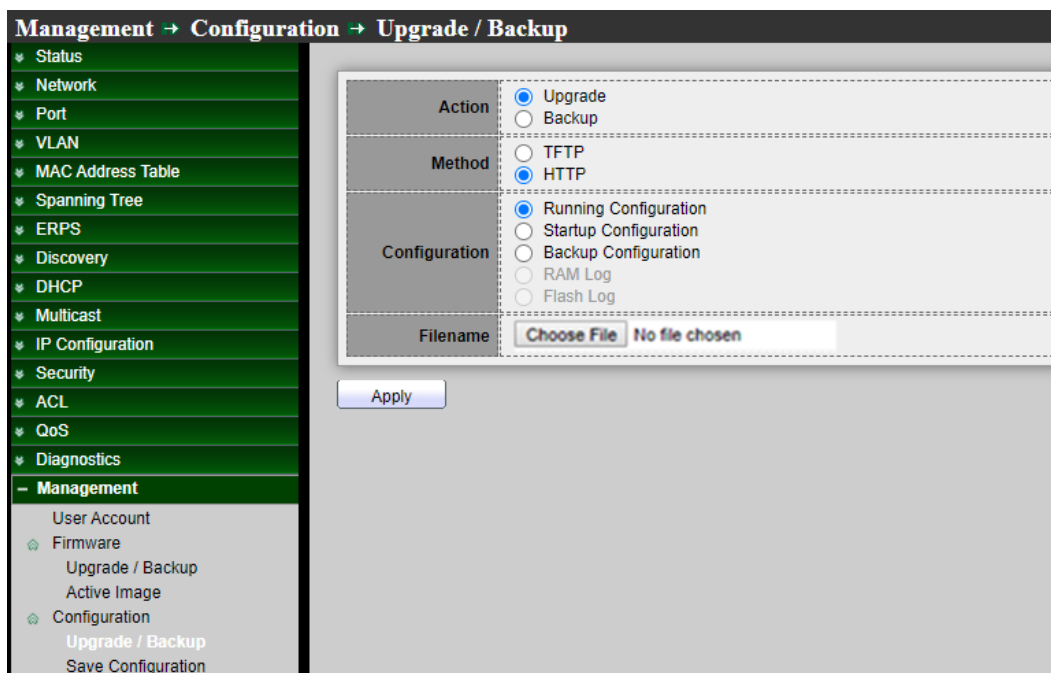

Field	Description
<b>Active Image</b>	<ul style="list-style-type: none"> <li>• <b>Firmware:</b> Firmware image.</li> <li>• <b>Version:</b> Firmware version..</li> <li>• <b>Name:</b> Firmware name.</li> <li>• <b>Size:</b> Firmware image size.</li> <li>• <b>Created:</b> Firmware image created date.</li> </ul>
<b>Backup Image</b>	<ul style="list-style-type: none"> <li>• <b>Firmware:</b> Firmware image.</li> <li>• <b>Version:</b> Firmware version..</li> <li>• <b>Name:</b> Firmware name.</li> <li>• <b>Size:</b> Firmware image size.</li> <li>• <b>Created:</b> Firmware image created date.</li> </ul>

Click the **“Apply”** button to save your changes settings.

## 18.3 Configuration

### 18.3.1 Upgrade / Backup

Administrator can backup system configuration file to PC or upload configuration file to Switch system, This page allow user to upgrade or backup firmware image through HTTP or TFTP server.

### Upgrade Configuration

- **Action:** Configuration operations.
  - **Upgrade:** Upgrade firmware from remote host to DUT.
  - **Backup:** Backup firmware image from DUT to remote host.
- **Method:** Configuration upgrade method.
  - **TFTP:** Using TFTP to upgrade firmware.
  - **HTTP:** Using WEB browser to upgrade firmware.
- **Configuration:** Configuration Type.
  - **Running Configuration:** Merge to current running configuration file.
  - **Startup Configuration:** Replace startup configuration file.
  - **Backup Configuration:** Replace backup configuration file.
- **Address Type:** Specify TFTP server address type
  - **Hostname:** Use domain name as server address.
  - **IPv4:** Use IPv4 as server address.
  - **IPv6:** Use IPv6 as server address

- **Server Address:** Specify TFTP server address.
- **Filename:** Configuration file name on remote TFTP server.

Click the **“Apply”** button to save your changes settings.

## Backup Configuration

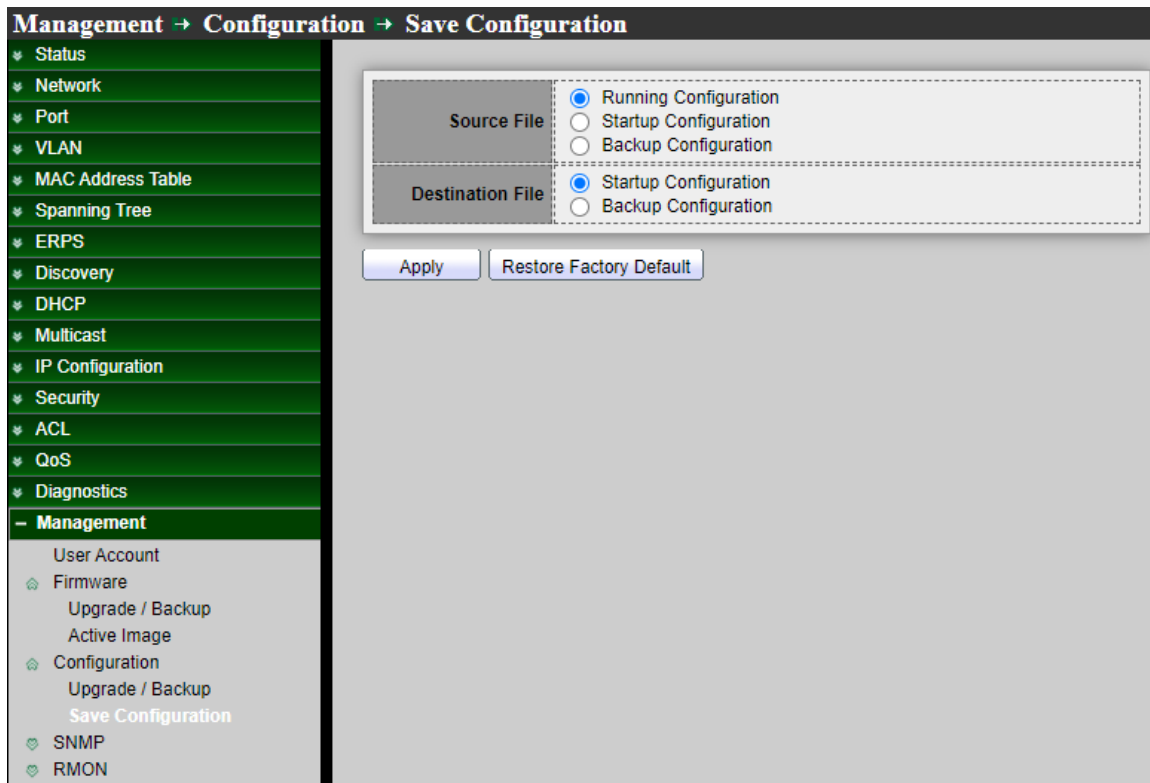

<b>Action</b>	<input type="radio"/> Upgrade <input checked="" type="radio"/> Backup
<b>Method</b>	<input type="radio"/> TFTP <input checked="" type="radio"/> HTTP
<b>Configuration</b>	<input checked="" type="radio"/> Running Configuration <input type="radio"/> Startup Configuration <input type="radio"/> Backup Configuration <input type="radio"/> RAM Log <input type="radio"/> Flash Log

- **Action:** Configuration operations.
  - **Upgrade:** Upgrade firmware from remote host to DUT.
  - **Backup:** Backup firmware image from DUT to remote host.
- **Method:** Configuration backup method.
  - **TFTP:** Using TFTP to backup firmware.
  - **HTTP:** Using WEB browser to backup firmware.
- **Configuration:** Configuration Type.
  - **Running Configuration:** Backup running configuration file.
  - **Startup Configuration:** Backup start configuration file.
  - **Backup Configuration:** Backup backup configuration file.
  - **RAM Log:** Backup log file stored in RAM.
  - **Flash Log:** Backup log files store in Flash.

Click the **“Apply”** button to save your changes settings.

## 18.3.2 Save Configuration

When administrator to click Apply on any window, changes that you made to the switch configuration settings are stored only in the Running Configuration. To preserve the parameters in the Running Configuration, the Running Configuration must be copied to another configuration type or saved as a file on another device, This page allow user to manage configuration file saved on DUT and click “Restore Factory Default” button to restore factory defaults.

- **Source File:** Source file types
  - **Running Configuration:** Copy running configuration file to destination.
  - **Startup Configuration:** Copy startup configuration file to destination.
  - **Backup Configuration:** Copy backup configuration file to destination.
- **Destination File:** Destination file types.
  - **Startup Configuration:** Save file as startup configuration.
  - **Backup Configuration:** Save file as backup configuration.

Click the “**Apply**” button to save your changes or **Click “Restore Factory Default” the button to back to factory default setting.**

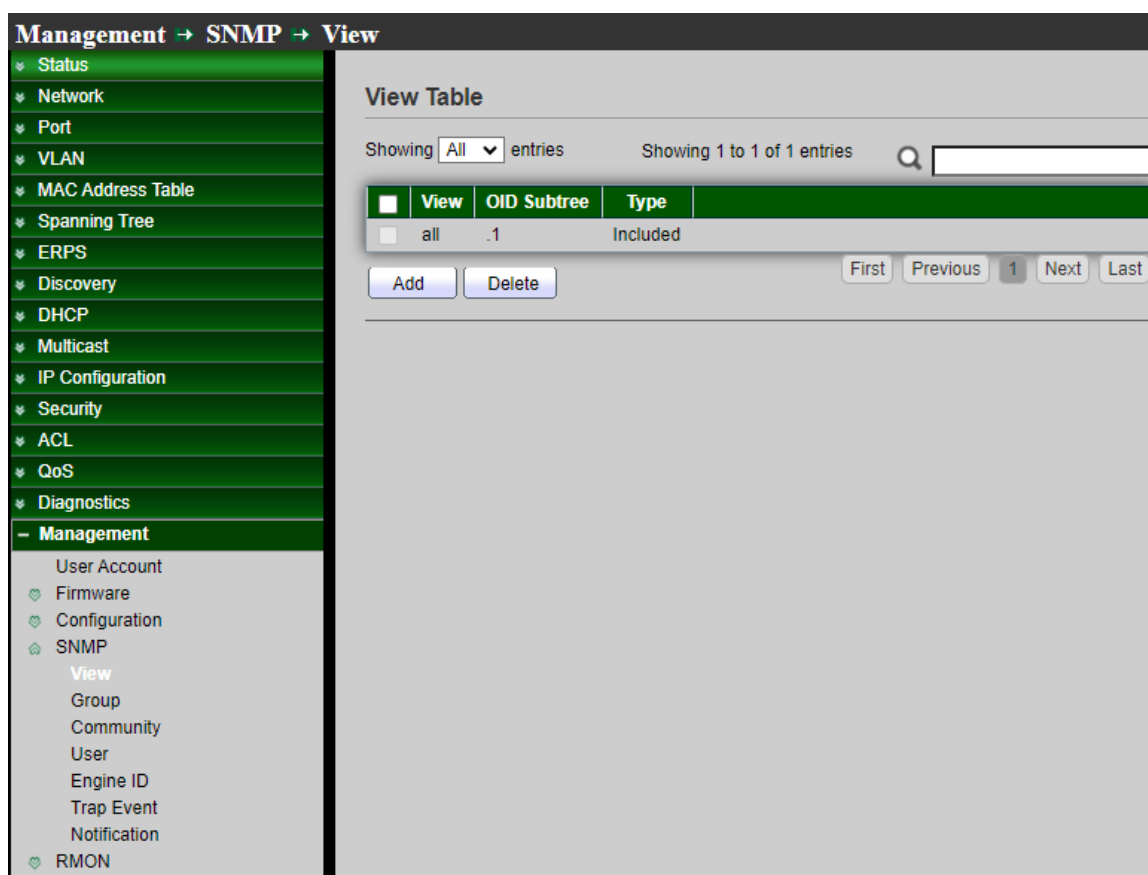

## 18.4 SNMP

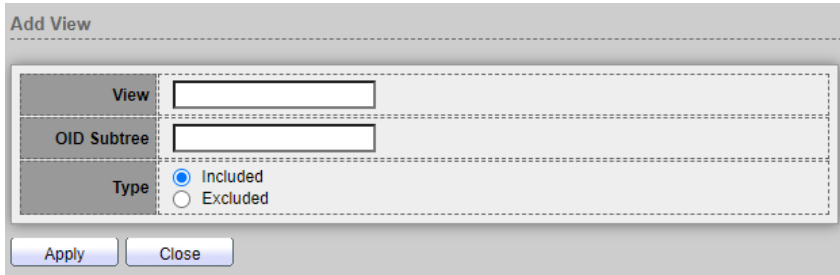

The SNMP supports SNMP v1, v2, and v3. It also reports system events to trap receivers using the traps defined in the Management Information Base (MIB) that it supports.

### 18.4.1 View

A view is a user-defined label for a collection of MIB tree subtrees. Each subtree ID is defined by the OID of the root of the relevant subtrees. You can either use well-known names to specify the root of the desired subtree or enter an OID. Setting “add” or “Delete” to management.

Field	Description
<b>View</b>	The SNMP view name. Its maximum length is 30 characters.
<b>Subtree OID</b>	Specify the ASN.1 subtree object identifier (OID) to be included or excluded from the SNMP view.
<b>View Type</b>	Include or exclude the selected MIBs in the view.

The 'Add View' dialog box contains the following fields and controls:

- View:** A text input field for entering a unique view name.
- OID Subtree:** A text input field for selecting an OID subtree.
- Type:** A radio button group with two options:  Included and  Excluded.
- Buttons:** 'Apply' and 'Close' buttons at the bottom.

- **View:** Enter a unique view name.
- **Object Subtree:** Select User Defined to manually define an OID, or select an existing OID from the list. All descendent of this node will be included or excluded in the view.
- **Type:**
  - Include: Check to include the selected MIBs in this view.
  - Excluded: Check to Excluded the selected MIBs in this view.

### 18.4.2 Group

In SNMPv1 and SNMPv2, a community string is sent along with the SNMP frames. The community string acts as a password to gain access to an SNMP agent. However, neither the frames nor the community string are encrypted. So SNMPv1 and SNMPv2 are not secure. In SNMPv3 can configure Authentication and Privacy is more secure. Setting “add” and “Edit” and “Delete” function for this management

### Group Table

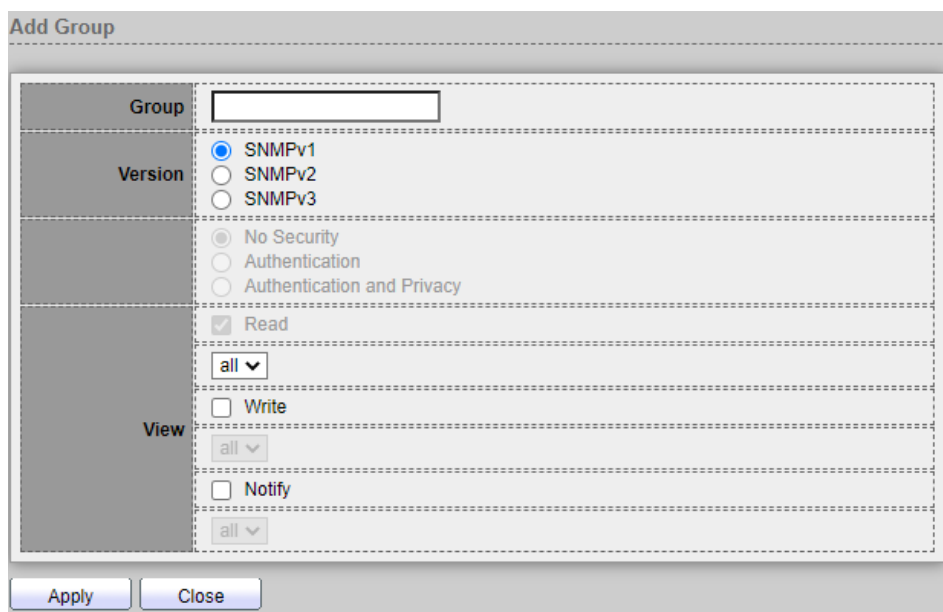

Showing All entries      Showing 0 to 0 of 0 entries

Group	Version	Security Level	View		
			Read	Write	Notify
0 results found.					

Configure \_\_\_\_\_ to associate a non-default view with a group.

Field	Description
<b>Group</b>	Specify SNMP group name, and the maximum length is 30 characters.
<b>Version</b>	Specify SNMP version <ul style="list-style-type: none"> <li><b>SNMPv1:</b> SNMP Version 1.</li> <li><b>SNMPv2:</b> Community-based SNMP Version 2c.</li> <li><b>SNMPv3:</b> User security model SNMP version 3.</li> </ul>
<b>Security Level</b>	Specify SNMP security level <ul style="list-style-type: none"> <li><b>No Security :</b> Specify that no packet authentication is performed.</li> <li><b>Authentication:</b> Specify that no packet authentication without encryption performed.</li> <li><b>Authentication and Privacy:</b> Specify that no packet authentication with encryption is performed.</li> </ul>
<b>Version</b>	Specify SNMP version <ul style="list-style-type: none"> <li><b>SNMPv1:</b> SNMP Version 1.</li> <li><b>SNMPv2:</b> Community-based SNMP Version 2c.</li> <li><b>SNMPv3:</b> User security model SNMP version 3.</li> </ul>
<b>Security Level</b>	Specify SNMP security level <ul style="list-style-type: none"> <li><b>No Security :</b> Specify that no packet authentication is performed.</li> <li><b>Authentication:</b> Specify that no packet authentication without encryption</li> </ul>

	performed.
	<ul style="list-style-type: none"> <li>• <b>Authentication and Privacy:</b> Specify that no packet authentication with encryption is performed.</li> </ul>
<b>View</b>	<p>Specify SNMP version</p> <ul style="list-style-type: none"> <li>• <b>Read:</b> Group read view name..</li> <li>• <b>Write:</b> Group write view name.</li> <li>• <b>Notify:</b> The view name that sends only traps with contents that is included in SNMP view selected for notification.</li> </ul>
<b>Read</b>	Group read view name
<b>Write</b>	Group write view name.
<b>Notify</b>	The view name that sends only traps with contents that is included in SNMP view selected for notification.

- **Group:** Specify SNMP group name, and the maximum length is 30 characters.
- **Version:** Specify SNMP version.
  - **SNMPv1:** SNMP Version 1.
  - **SNMPv2:** Community-based SNMP Version 2c.
  - **SNMPv3:** User security model SNMP version 3.
- **Security Level:** Specify SNMP security level.
  - **No Security :** Specify that no packet authentication is performed.
  - **Authentication:** Specify that no packet authentication without encryption is performed.

- **Authentication and Privacy:** Specify that no packet authentication with encryption is performed.
- **View:**
  - **Read :** Select read view name if Read is checked.
  - **Write:** Select write view name, if Write is checked.
  - **Notify:** Select notify view name, if Notify is checked.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 18.4.3 Community

Communities are only defined in SNMPv1 and v2 because SNMPv3 works with users instead of communities. The users belong to groups that have access rights assigned to them, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

**Management → SNMP → Community**

Community Table

Showing All entries      Showing 1 to 1 of 1 entries

<input type="checkbox"/>	Community	Group	View	Access
<input type="checkbox"/>	public	all		Read-Only

First Previous 1 Next

The access right of a community is defined by a group under advanced mode. Configure to associate a group with a community.

Add Edit Delete

Field	Description
<b>Community</b>	The SNMP community name. Its maximum length is 20 characters.
<b>Community</b>	SNMP Community mode. <ul style="list-style-type: none"> <li>• <b>Basic:</b> snmp community specifies view and access right.</li> <li>• <b>Advanced:</b> snmp community specifies group.</li> </ul>
<b>Group</b>	Specify the SNMP group configured by the command <b>SNMP group</b> to define the object available to the community.
<b>View</b>	Specify the SNMP view to define the object available to the community.
<b>Access</b>	SNMP access mode <ul style="list-style-type: none"> <li>• <b>Read-Only:</b> Read only.</li> <li>• <b>Read-Write:</b> Read and write.</li> </ul>

The screenshot shows a dialog box titled "Add Community". It has a dashed border and contains the following fields:

- Community:** A text input field.
- Type:** Radio buttons for "Basic" (selected) and "Advanced".
- View:** A dropdown menu currently showing "all".
- Access:** Radio buttons for "Read-Only" (selected) and "Read-Write".
- At the bottom, there are "Apply" and "Close" buttons.

- **Community:** The SNMP community name. Its maximum length is 20 characters.
- **Type:** Specify SNMP version.
  - **Basic:** SNMP community specifies view and access right ,The access rights of a community can configure with Read Only or Read Write. In addition, Administrator can restrict the access to the community to only certain MIB objects by selecting a view.
  - **Advanced:** SNMP community specifies group, The access rights of a community are defined by a group. You can configure the group with a specific security model. The access rights of a group are Read, Write, and Notify.
  - **View:** Specify the SNMP view to define the object available to the community.
- **Access:** SNMP access mode.
  - **Read Only:** Read only , Management access is restricted to read-only. Changes cannot be made to the community.

- **Read Write:** Read and write , Management access is read-write. Changes can be made to the switch configuration, but not to the community.
- **Group:** If set Type for specify SNMP version to “Advanced” type, Must be set specify the SNMP group configured by user to define the object available to the community.

Click the “Apply” button to save your changes or “Close” the button to close settings.

## 18.4.4 User

An SNMP user is defined by the login credentials (username, passwords, and authentication method) and by the context and scope in which it operates by association with a group and an Engine ID. The configured user has the attributes of its group, having the access privileges configured within the associated view.

Groups enable network managers to assign access rights to a group of users, instead of a single user. A user can only be a member of a single group.

Administrator need to create a SNMPv3 user, a SNMPv3 group must be available, Setting “add” and “Edit” and “Delete” function for this management.

**Management → SNMP → User**

**User Table**

Showing All entries      Showing 0 to 0 of 0 entries

User	Group	Security Level	Authentication Method	Privacy Method
0 results found.				

First Previous 1 Next

Configure to associate an SNMPv3 group with an SNMPv3 user.

Add Edit Delete

Field	Description
User	Specify the SNMP user name on the host that connects to the SNMP agent. The max character is 30 characters. For the SNMP v1 or v2c, the user name must match the community name
Group	Specify the SNMP group to which the SNMP user belongs.
Security Level	SNMP privilege mode <ul style="list-style-type: none"> <li>• <b>No Security</b> : Specify that no packet authentication is performed.</li> <li>• <b>Authentication</b>: Specify that no packet authentication without encryption is performed.</li> <li>• <b>Authentication and Privacy</b>: Specify that no packet authentication with encryption is performed.</li> </ul>
Authentication Method	Authentication Protocol which is available when Privilege Mode is <b>Authentication</b> or <b>Authentication and Privacy</b> . <ul style="list-style-type: none"> <li>• <b>None</b>: No authentication required.</li> <li>• <b>MD5</b>: Specify the HMAC-MD5-96 authentication protocol.</li> <li>• <b>SHA</b>: Specify the HMAC-SHA-96 authentication protocol.</li> </ul>
Privacy Method	Encryption Protocol <ul style="list-style-type: none"> <li>• <b>None</b>: No privacy required.</li> <li>• <b>DES</b>: DES gorithm</li> </ul>

**Add User**

User	<input type="text" value="number2"/>

<b>Authentication</b>	
Method	<input type="radio"/> None <input type="radio"/> MD5 <input checked="" type="radio"/> SHA
Password	<input type="text" value="123456789Q"/>
<b>Privacy</b>	
	<input type="radio"/> None <input type="radio"/> DES
	<input type="text"/>

- **User:** Specify the SNMP user name on the host that connects to the SNMP agent. The max character is 30 characters.
- **Security Level:** SNMP privilege mode.
  - **No Security:** Specify that no packet authentication is performed.
  - **Authentication:** Specify that no packet authentication without encryption is performed.
  - **Authentication and Privacy:** Specify that no packet authentication with encryption is performed.

### Authentication

- **Method:** Authentication Protocol which is available when Privilege Mode is Authentication or Authentication and Privacy.
  - **None:** No authentication required.
  - **MD5:** Specify the HMAC-MD5-96 authentication protocol.
  - **SHA:** Specify the HMAC-SHA-96 authentication protocol.
- **Password:** The authentication password, The number of character range is 8 to 32 characters.

### Privacy

- **Method:** Encryption Protocol.
  - **None:** No privacy required.
  - **DES:** DES algorithm.
  - **SHA:** Specify the HMAC-SHA-96 authentication protocol.
- **Password:** The privacy password, The number of character range is 8 to 64 characters.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

#### 18.4.5 Engine ID

The Engine ID is only used by SNMPv3 entities to uniquely identify them. An SNMP agent is considered an authoritative SNMP engine. This means that the agent responds to incoming messages (Get, GetNext, GetBulk, Set), and sends trap messages to a manager.

Each SNMP agent maintains local information that is used in SNMPv3 message exchanges. The default SNMP Engine ID is comprised of the enterprise number and the default MAC address. The SNMP Engine ID must be unique for the administrative domain, so that no two devices in a network have the same Engine ID, Setting **“add”** and **“Edit”** and **“Delete”** function for this

management.

## Local Engine ID

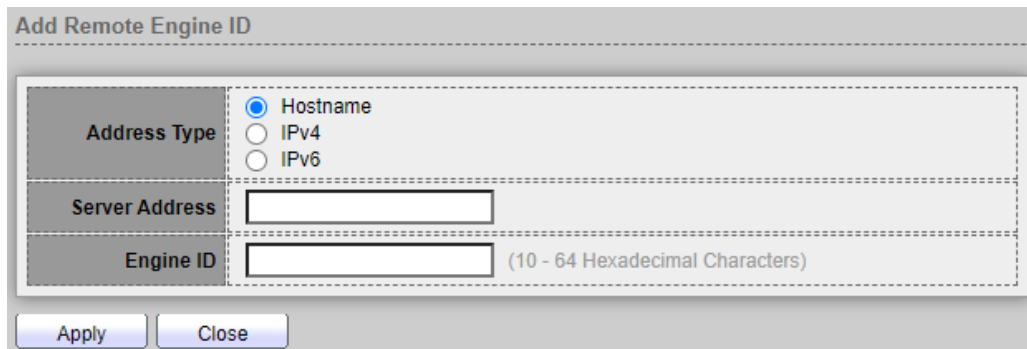

- **Engine ID:** If checked “User Defined”, the local engine ID is configure by user, else use the default Engine ID which is made up of MAC and Enterprise ID, The user defined engine ID is range 10 to 64 hexadecimal characters, and the hexadecimal number must be divided by 2.

Click the **“Apply”** button to save your changes settings.

## Remote Engine ID Table

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

Field	Description
Server Address	Remote host.
Engine ID	Specify Remote SNMP engine ID. The engine ID is range 10 to 64 hexadecimal characters, and the hexadecimal number must be divided by 2.

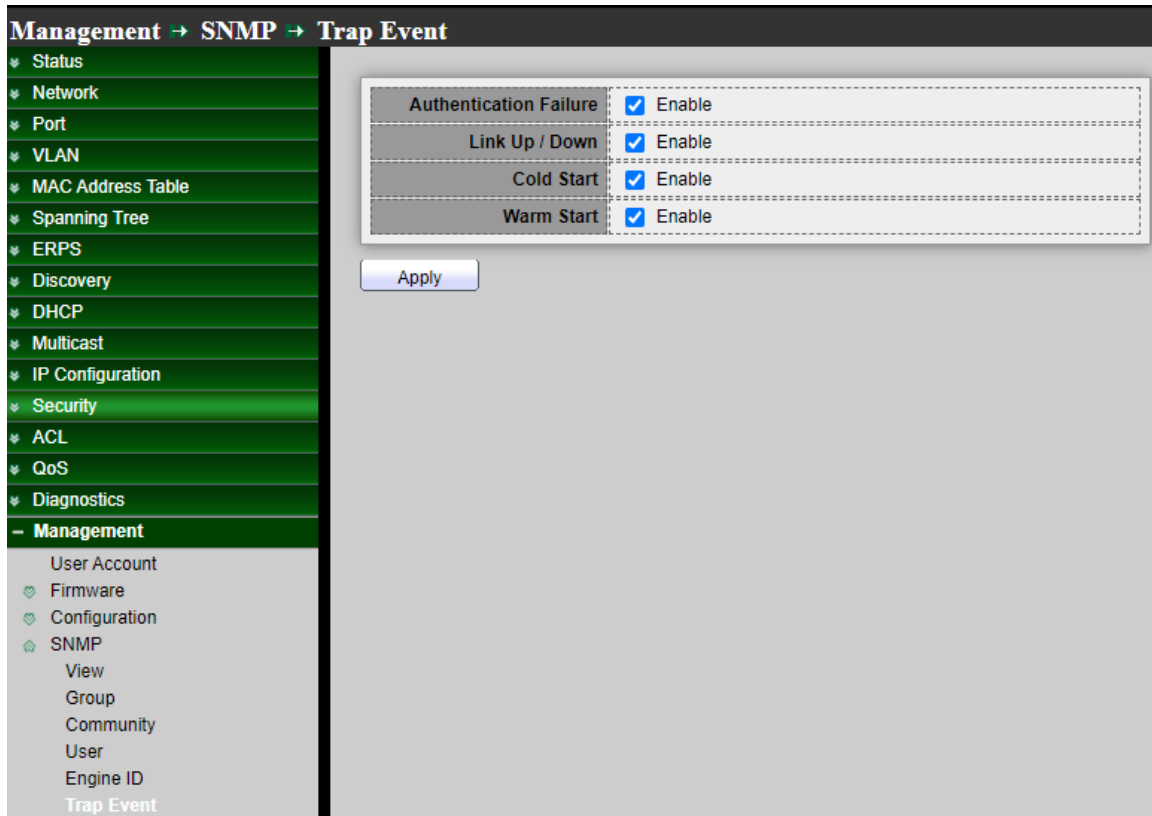

- **Address Type:** Remote host address type for Hostname/IPv4/IPv6.
- **Server Address:** Remote host.
- **Engine ID:** Specify Remote SNMP engine ID. The engine ID is range 10 to 64 hexadecimal characters, and the hexadecimal number must be divided by 2.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

### 18.4.6 Trap Event

Administrator can choose SNMP Trap Event Type to monitor

Trap messages are generated to report system events, as defined in RFC 1215. The system can generate traps defined in the MIB that it supports.

Field	Description
<b>Authentication Failure</b>	SNMP authentication failure trap, when community not match or user authentication password not match.
<b>Link Up/Down</b>	Port link up or down trap
<b>Cold Start</b>	Device reboot configure by user trap
<b>Warm Start</b>	Device reboot by power down trap

Click the **“Apply”** button to save your changes settings.

### 18.4.7 Notification

Notification is network nodes where the trap messages are sent by the switch. A list of notification recipients are defined as the targets of trap messages. A trap receiver entry contains the IP address of the node and the SNMP credentials corresponding to the version that will be included in the trap message. When an event arises that requires a trap message to be sent, it is sent to every node listed in the Notification Recipient Table, , Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

**Management → SNMP → Notification**

**Notification Table**

0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0

Field	Description
<b>Port</b>	The port for the RMON statistics.
<b>Bytes Received</b>	Number of octets received, including bad packets and FCS octets, but excluding framing bits.
<b>Drop Events</b>	Number of packets that were dropped.
<b>Packets Received</b>	Number of packets received, including bad packets, Multicast packets, and Broadcast packets.
<b>Broadcast Packets</b>	Number of good Broadcast packets received. This number does not include Multicast packets.
<b>Multicast Packets</b>	Number of good Multicast packets received.
<b>CRC &amp; Align Errors</b>	Number of CRC and Align errors that have occurred.

<b>Undersize Packages</b>	Number of undersized packets (less than 64 octets) received.
<b>Oversize Packages</b>	Number of oversized packets (over 1518 octets) received.
<b>Fragments</b>	Number of fragments (packets with less than 64 octets, excluding framing bits, but including FCS octets) received.
<b>Jabbers</b>	<p>Number of received packets that were longer than 1632 octets. This number excludes frame bits, but includes FCS octets that had either a bad FCS (Frame Check Sequence) with an integral number of octets (FCS Error) or a bad FCS with a non-integral octet (Alignment Error) number. A Jabber packet is defined as an Ethernet frame that satisfies the following criteria:</p> <ul style="list-style-type: none"> <li>• Packet data length is greater than MRU.</li> <li>• Packet has an invalid CRC.</li> <li>• RX error event has not been detected.</li> </ul>
<b>Collision</b>	Number of collisions received. If Jumbo Frames are enabled, the threshold of Jabber Frames is raised to the maximum size of Jumbo Frames.
<b>Frames of 64 Bytes</b>	Number of frames, containing 64 bytes that were received.
<b>Frames of 65 to 127 Bytes</b>	Number of frames, containing 65 to 127 bytes that were received.
<b>Frames of 128 to 255 Bytes</b>	Number of frames, containing 128 to 255 bytes that were received.
<b>Frames of 256 to 511 Bytes</b>	Number of frames, containing 256 to 511 bytes that were received.
<b>Frames of 512 to 1024 Bytes</b>	Number of frames, containing 512 to 1023 bytes that were received.
<b>Frames Greater than 1024 Bytes</b>	Number of frames, containing 1024 to 1518 bytes that were received

## 18.5.2 History

Use the History Control Table page to define the sampling frequency, amount of samples to store, and the interface from where to gather the data. After the data is sampled and stored, it appears on the History Table page that can be viewed by clicking History Table, , Setting “add” and “Edit” and “Delete” and “View” function for this management.

Entry	Community	Description	Notification	Time	Owner
0 results found.					

First Previous

The SNMP service is currently disabled.  
For RMON configuration to be effective, the \_\_\_\_\_ must be enabled.

Field	Description
Port	Specify port for the RMON history.
Max Sample	Specify the maximum number of buckets.
Interval	Specify the number of seconds for each sample.
Owner	Specify the owner name of event (0~31 characters).

#### Add Event

Entry	1
Notification	<input checked="" type="radio"/> None <input type="radio"/> Event Log <input type="radio"/> Trap <input type="radio"/> Event Log and Trap
Community	<input type="text" value="Default Community"/>
Description	<input type="text" value="Default Description"/>
Owner	<input type="text"/>

- **Community:** The SNMP community name. Its maximum length is 20 characters.
- **Notification:** Specify the notification type for the event, and the possible value are.
  - **None:** Nothing for notification.
  - **Event Log:** Logging the event in the RMON Event Log table.
  - **Trap:** Send a SNMP trap.
  - **Event Log and Trap:** Logging the event and send the SNMP trap
- **Community:** Specify the SNMP community when the notification type is specified as “Trap” and “Event Log and Trap”.
- **Description:** Specify the description for the event.
- **Owner:** Specify owner for the event.

Click the **“Apply”** button to save your changes or **“Close”** the button to close settings.

## 18.5.4 Alarm

RMON alarms provide a mechanism for setting thresholds and sampling intervals to generate exception events on any counter or any other SNMP object counter maintained by the agent. Both the rising and falling thresholds must be configured in the alarm. After a rising threshold is crossed, no rising events are generated until the companion falling threshold is crossed. After a falling alarm is issued, the next alarm is issued when a rising threshold is crossed, Setting **“add”** and **“Edit”** and **“Delete”** function for this management.

Field	Description
Port	The port configuration for the RMON alarm.
Counter	<p>The counter for sampling</p> <ul style="list-style-type: none"> <li>• <b>DropEvents (Drop Event):</b> Total number of events received in which the packets were dropped.</li> <li>• <b>Octes (Received Bytes):</b> Octets.</li> <li>• <b>Pkts (Received Packets):</b> Number of packets.</li> <li>• <b>BroadcastPkts (Broadcast Packets Received):</b> Broadcast packets.</li> <li>• <b>MulticastPkts (Multicast Packets Received):</b> Multicast packets.</li> <li>• <b>CRCAlignError (CRC and Align Error):</b> CRC alignment error.</li> <li>• <b>UndersizePkts (Undersize Packets):</b> Number of undersized packets.</li> <li>• <b>OversizePkts (Oversize Packets):</b> Number of oversized packets.</li> <li>• <b>Fragments (Fragments):</b> Total number of packet fragment.</li> <li>• <b>Jabbers (Jabbers):</b> Total number of packet jabber.</li> <li>• <b>Collisions (Collisions):</b> Collision.</li> <li>• <b>Pkts64Octetes (Frames of 64 Bytes):</b> Number of packets size 64 octets.</li> <li>• <b>Pkts65to127Octetes (Frames of 65 to 127 Bytes):</b> Number of packets size 65 to 127 octets.</li> <li>• <b>Pkts128to255Octetes (Frames of 128 to 255 Bytes):</b> Number of packets size 128 to 255 octets.</li> <li>• <b>Pkts256to511Octetes (Frames of 256 to 511 Bytes):</b> Number of packets size 256 to 511 octets.</li> <li>• <b>Pkts512to1023Octetes (Frames of 512 to 1023 Bytes):</b> Number of packets size 512 to 1023 octets.</li> <li>• <b>Pkts1024to1518Octetes (Frames Greater than 1024 Bytes):</b> Number of packets size 1024 to 1518 octets.</li> </ul>
Version	<p>The sampling type including:</p> <ul style="list-style-type: none"> <li>• <b>Absolute:</b> The selected variable value is compared directly with the thresholds at the end of the sampling interval</li> <li>• <b>Delta:</b> The selected variable value of the last sample is subtracted from the current value and the difference is compared with the thresholds.</li> </ul>
Interval	The number of seconds for each sample.

---

<b>Owner</b>	The owner for the alarm entry.
<b>Trigger</b>	The type of event triggering.
<b>Rising Threshold</b>	The threshold for firing rising event.
<b>Rising Event</b>	The rising event when alarm was fired.
<b>Falling Threshold</b>	The threshold for firing falling event.
<b>Falling Event</b>	The falling event when alarm was fired.

---
